From: fmitch@netcom.com
Message-ID: <fmitchCIxFGJ.90F@netcom.com>
Source record: 228429

hi, mitch wa4osr here in mobile, alabama...

i am interested in the Patriot Communications Technology, Inc. model PC-1610 transceiver which is being advertised with full page ads in 73 and cq magazines...

i faxed patriot for more info and received a nice package back from them... i received a prompt reply, less than a week...

the rig is getting closer to the all in one box... it has rtty and cw modems "built in" and a lcd display... you plug in an ibm pc type keyboard (not supplied) to control the rig plus use the internal modems... it also supports 300 baud ascii... and, for the first rig in many years, uses *phasing* techniques to eliminate the unwanted sideband!!! power output is 75 watts, the rig is 13 in. wide, 12 in. deep, and 3.5 in high... it weighs 10 pounds...

the complete specs are too much for me to type in for this posting... but i suggest you write or call patriot if you want additional info... i would be *very* interested in hearing from anyone who gets one...

the address is:
Patriot Communications technology, Inc.
7 Flowerfield M100
St. James, NY 11780
516-862-6512
516-862-6529

also, does anyone know anything about the company???

mitch, wa4osr

The preceding article "Looking for information" is flame-bait. Maybe I am thinking wishfully, but it would be nice if we could keep responses in e-mail rather than watching another silly flame war erupt over nothing. Thanks...

3. Yaesu FT-530 CTCSS Scan

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-01 03:18:34 UTC
From: leber@panther.warm.inmet.com
Message-ID: <CIxL6y.IAJ@inmet.camb.inmet.com>
Source record: 228431

OK, I took the plunge and picked up a new FT-530 while the coupon deal was still in effect. I've got most of it figured out, but for the life of me, I can't get the CTCSS Scan feature going. I follow the steps in the manual ('FM'>'Set/0'>'FM'>'T Set/2'), but nothing happens...no confirmation tone, nothing. Could there be a typo in the manual? I have some suspicions of this, since the key function summary chart for the 'T Set' button shows 'no function' for this combination.

Also, would someone summarize the recent traffic regarding known problems with the 530? So far, I haven't noticed anything unusual other than some slight noise on 145.13 (sounds kind of like ignition noise, but appears to be of internal origin).

Happy New Year and 73,
Tom

The sequence for tone scan is: 'FM'>'TSet/2' then press and hold 'MHz/^' or
'MHz/v' for about a second.

Make sure you have Tone turned on: 'FM'>'Tone/1'

Message-ID: <134_9401011738@blkcat.fidonet.org>
Source record: 228432

I am looking for a source of telescoping antenna masts in the 25 to 35 foot range.

I have seen them at hamfests and I can kick myself for not having bought one then.

I have seen a couple of different types, they all seem to be surplus, have either a mechanical or hydralic means of raising and sell for $100-$150 in good condition. The bottom sections are around 5" in diameter and the tops are 2" in diameter.

I need one to support a 144 & 432 Mhz quad and a 6M X-Beam.

If anyone knows where I can find one please let me know.

It works... Basically, what is happening is that you put the rig in Tone Squelch Mode and then as you would normally be "dialing" or using the MHz UP/DOWN buttons to select a tone frequency, you HOLD DOWN the MHz UP/DOWN button for a second to literally start "scanning" the tone frequencies. If the signal you are tuned to is in fact "tone encoded" and is one of the EIA standard freqs, the rig will stop on the frequency and the tone squelch will "open" allowing you to hear the conversation.

OK, Thanks Guys. Turns out I just forgot to put it into tone squelch first.

Definitely a nice radio. Deserves a better manual.

Cheers,
Tom

[Posted on Mon, 3 Jan 1994 09:49:03 GMT]

Hi,

1-I own a RCI 2950 radio CB and I would like to modify it so I could
control it with a computer. I need plans to add a RS232C to the RCI
or someone help for the right way to do it. Can somebody help ?

2- Does anybody know a FTP site where I could FTP modifications files
or plans ?

3- Does someone knows the meaning of the 6 mike pins for the RCI 2950 ?

Thanks for replies.

Cheers, Laurent.

I'm looking for some comments on window mount antennas; specifically a 2 meter Antenna Specialties antenna... A friend told me that they do not work too well.

I want to set up my vehicle and avoid drilling holes, so I'm looking at either a magnetic mount or a coupled through the glass window mount antenna.

Any comments?

Thanks,
Joel Derby

I've got 3 of them and I'm quite happy. They don't take too much power (<100W)
and they are fairly narrow, but if you put them on the back window and tilt
them back about 45deg, then you don't have trouble in cement parking lots. Mag
mounts are a pain to take off in a parking lot, and the stress of waving around
in the wind causes the paint to flake on the metal of the roof where the flexing occurs..
My constraints are convenience and beig able to get out at all.
If you want higher powernad further range - then use a 5/8 mag mount - I just
need to hit the repeaters and go shopping in the car.

I bought a mag-mount with a heavy-duty magnet. I don't think it would blow
off in any kind of wind that would leave the car itself undamaged. I think
it's more flexible than a through-the-glass antenna - I used it on someone
else's car last weekend, for example.

If you want to avoid drilling the hole, hire someone else to do it.
Most two way shops will do it for a reasonable charge. The through
glass antennas are no substitute for a properly mounted antenna.

If you're worried about aesthetics, the on glass antennas look
even sillier. If you're worried about resale, just market it as
"cellular ready", a feature. If you've got a power sunroof, well
now you've got an excuse. Your best bet in that case is the Antenna
Specialist *disguise* antenna. It replaces your original entertainment
radio antenna, in the original factory hole, and comes with a duplexer
to allow both radios to work. It's not as good as a Larsen NMO in the
middle of the roof, but it'll beat hell out of through glass antennas.

Magmounts are good expedients for rental cars. Hertz tends to get
a bit testy when you return their cars "cellular ready". :-)

Boy am I upset.. had my first bad experience with a ham company.

I purchased the Cmos superkeyer II from R&R associates. Had it working and then put it away. took it out about 3 weeks later for a contest. The keyer went crazy. I checked the circuit.. nothing wrong.. finally got the chip out of my Idiom Press version and stuck it in the circuit..worked fine.. seemed it was definetly the chip.

Wrote a long letter and sent the chip back to R&R. Dick had chip for a long time. .got it back today.. he told me to send it back to Bud Southard.. no address or anything.. told me to check for a bad soldering joint.. also gave me the address of Innovative Electronics and told me to deal with them .. because that is where he gets the chips from..

I bought the kit from R&R.. think they should have done something.

Anyone have a phone # for R&R or know who Bud Southard is.

I think this Dick, is definelty a real .....

Source record: 228445

~From: msattler@netcom.com (Michael Sattler)

The Complete (and Mostly Accurate) Guide to Undocumented Features
of the Kenwood TH-78a Handheld Transceiver

15 Dec 1993

PURPOSE: This file contains descriptions of all the undocumented features
of the TH-78a I could find as of this date. It doesn't attempt to explain
anything covered in the manual, but it does pass on pointers to interesting
uses of documented features (such as using message write 0 as a start-up
screen).

VALIDITY: This file supercedes the following: th78a-0.mod, th78a-1.mod,
th78a-2.mod, th78a-complete.mod, th78a-new.mod, th78a-warn.mod. I've run
this file by the authors of those mod files, where I could find them. Be
assured that you have the best information about the TH-78a we could put
together.

WARNING: This information is furnished without guarantee or warranty.
Working with surface-mount diodes is delicate work. Or as Eric Williams
(wd6cmu@netcom.com) so eloquently says "Lawyer bait: If you screw up your
radio, it's your own damn fault, don't blame me. (But it worked on mine.)"
These modifications (mods) may or may not work on your particular unit
according to Kenwood. I certainly accept no responsibility for your
handiwork or your transmitting on frequencies that you're not allowed to.
You may have good reasons to transmit outside of ham bands as I do during
search and rescue work (typically on CLEMARS, NLEMARS, and CALCOORD).

ACCURACY: Please mail me at msattler@netcom.com if you see any omissions or
mistakes. Make sure to pass along the date of the version you're seeing
(it's just under the title).

THANKS: Thanks be to all those who helped me, including
George_Lin@mindlink.bc.ca, Brendan_Hoar@notes.pw.com, rfc@allegra.att.com,
wd6cmu@netcom.com

AVAILABILITY: I'll attempt to have the latest version of this file (named
"th78a.kensho") placed at the following mod servers:

Server Directory
---
ham.eetech.mcgill.ca /pub/ham-radio/mods
(aka atlas.eetech.mcgill.ca)

What is a "new" TH-78a?

Kenwood says that any TH-78a with a serial number greater than 405xxx is considered a "new" TH-78a. I've not authoritatively determined the difference between the old and new models, but the mods differ, so it's worthwhile to check the serial number. The ARTSCI 5A techmod book calls this the "Later Model (with green jumpers)". I use the terms "early model" and "late model" throughout this document.

William_A._Kirsanoff@smtpgty.anatcp.rock says:

"I can tell you the difference between an "old" and "new" TH-78A. The "old" 78As had a fault in the microprocessor resulting in an inability to store a pl tone in the call channels (and possibly some other bazaarities). People who complained got the new processor installed by Kenwood when it became

available (there are actually 2 microprocessors in the HT, I think the one changed is IC 5, mine has a paper label pasted over it). It seems they also added the jumpers on the programming diodes, probably to keep hams from using their soldering irons on the SMC diodes while making mods. :-) When my "old" unit was upgraded to the new processor, my mods from removing the diodes remained in place."

Basics of modifying the Kenwood TH-78a

To open the radio, follow the instructions on page 64 of the manual. (Unscrew four screws and break apart the radio halves.) The two TX/RX busy indicators (LEDs) have rubber seals placed over them. These have a tendency to fall off when opening or closing the radio.

All position references in this document assume that you are looking at the CPU board with the rotary encoders and TX/RX busy indicators at the top. If you have installed the ME-1 EEPROM, I recommend that you temporarily remove it to facilitate access to the diodes.

You'll see a brass shield about one centimeter square covering the processor chip and the surface-mount diodes on the back half of the radio. De-solder the shield's four corners and remove it. (I used an right angle surgical tweezers in conjunction with the pin-point soldering iron to lift the brass shield.)

Uncovered are the processor (which we ignore) and six surface-mount diodes, numbered sequentially from one through six (D1 - D6), top to bottom. These are about one millimeter wide; remember the note about skill and finesse. New model radios also have two large loops of green wire, numbered one through two (W1 - W2), bottom to top.

You'll need a pinpoint-tip soldering iron and some braid to wick away the solder before you lift out the diode. Alternatively, Rich Garcia (n2czf@wt3v.nj.usa) suggests leaving the diode in place. "I found if you BRIEFLY touch the iron to the right side lead while gently pulling up on the SMC diode it should completely come off without needing to apply heat to the other side and further risk board damage."

After you perform some or all of the mods listed below, replace the brass shield and re-assemble the radio. Then reset the processor (as documented) and re-enter any frequencies into memory.

Potential case design flaw

>From wb1e@k1rqg.me.usa.na (which no longer exists):

In the course of performing mods on my Kenwood TH-78a dual band handheld, I've discovered a potential flaw in the case design. While handling my walkie one day (after the mods were done), the display went blank and I could not turn the radio back on. With the radio split in half again, I could turn the radio back on but discovered all the memories were erased. The cause turned

out to be some component pins on the front face coming in contact with the square bodies of the two volume/channel/squelch switches, when the case is screwed back together snuggly. I placed small strips of electrical tape on the sides of the switches to insulate, and reassembled; problem solved. Now I have to reprogram the darn thing....

molson@bml4380.cpg.cdc.com (Mark Olson) said:

There is a warning on some of the rig mod bulletin boards about this. The problem is that pins on the back side of the PCB that is mounted on the front half of the TH78 can come into contact with the volume control housings mounted on the PCB on the other half of the unit. My radio had this problem until I put electrical tape across these housings. Symptoms were: Display blanking momentarily and the unit power cycling, sometimes causing memory erase, when pressure was applied to the front of the unit or to the volume controls. I originally thought that it was a loose battery connection...

Open up the radio and you will see what I mean... Believe me, the fix is simple and it works.

C-17 design flaw

William_A._Kirsanoff@smtpgty.anatcp.rockwell.COM said:

"The 78A WILL lose C-17 on the control board if dropped, period. This causes loss on receive audio on the left-hand side of the radio. The solder pads for that cap are not big enough. If you find the need to replace C-17, use a gap-fill cyanoacrylate glue like Zap-A-Gap (tm) to increase the device footprint. I have learned the hard way. Otherwise, I have found it to be a fine radio. My only problems have been related to the C-17 issue and attempts to rectify it. Had I been given the above advice, it would have been a one-time only issue. As it is, I took out one of the microprocessors yesterday looking for a bad solder joint that was induced by my attempt to solve the C-17 problem (sigh). This radio gets a lot of use and a lot of travel. C-17 is the only thing that I have broken with the case closed. :-)"

Mutually exclusive mods

Some of these mods are reputed to be mutually exclusive. You must choose one of the following levels of performance:

The "beyond MARS" mod - gets you the widest tx/rx
The "MARS/CAPS" mod - halfway there
The "extended receive" mod - more of a good thing

plus

The "cross-band repeat" mod - a repeater that weighs almost nothing

There is no mods that manipulate diodes D1 or D2 (I've seen it suggested elsewhere that this is toggles the USA/Europe-ness).

Brendan_Hoar@notes.pw.com suggests:

"I think removal of D1 causes "Forced Channelized Mode", at least on the "new" radios. If you put both VHF and UHF memories into a TH78A without D1 and
power on, you are stuck in channel mode until you do a full memory reset. Remember, you can't add frequencies or do any tuning in channel mode.

If you think about it, you'll want to be very careful not to let D1's circut become an open circut."

The "beyond MARS" mod

This mod provides the widest possible range of tx/rx. The mother of all TH-78a mods.

To mod (early model): remove diode D5 only.

To mod (late model): remove diode D3 and cut wire W1. D5 has priority over D3, so if you've already made the mods for the old model (which included the removal of D5) you must resolder D3 into D5.

Yields RX 50-179.995, TX 136-179.995, RX 300-399.995, RX 400-511.995, TX 400-511.995, RX 800-999.995.

To use: buttons operate the same way as described in the "extended receive" mod, except that you can transmit on a much wider range.

NOTE TO ALL: I haven't been able to verify the actual operation of my radio on all these freqs. Kenwood talks about the difference between the "dialable" range and the operating range. I'd like to come up with a chart for each level of mod that combines the above and the two following offerings. Help me, please.

* *

Left VFO Right VFO
50.000-85.2x (with beep) 50.000-110.xxx (with beep)
85.2x-179.995 110.xxx-179.995
300.00-399.975
400.000-511.9875 400.000-511.9875
800.00-999.9875

* *

Receive	Transmit
50-135.995 (AM)	VHF (NA)
136-179.995 "	136-179.995
300-399 (AM & FM) "	(NA)
400-511.99 SUB-UHF	400-511.99

400-511.99 UHF 400-511.99
900-949.9875 " (NA)
50-179.995 (FM) SUB-VHF 136-179.995

The "CAP/MARS" mod

This doesn't cover as much room as the beyond MARS mod does, but may be more appropriate for those who use the CAP or MARS frequencies.

To mod (early model): remove D6 only.

To mod (late model): not known.

Yields RX 118-173.995, TX 142-151.995, RX 400-511.995, TX 425-454.995.

The "extended receive" mod

This is the mod that's usually given to hams to pacify them (the beyond MARS mod is closely guarded).

To mod: remove diode D5.

To use: press 'F' for one second and then pressing the Band button will switch the UHF VFO to a 800-999.995 MHz band and the VHF VFO to a 300-399.995 MHz band. The regular VHF VFO can now receive down to 50 Mhz.

The "cross-band repeat" mod

Allows you to... (WHAT!?!)

To mod: remove diode D4.

To use: press 'F' for one second, then '0'. Repeat to disable. The MHz dot will flash when in repeater mode.

Toggle CALL button function

Press SHIFT during power-up This is described in the manual, but the documentation is not complete. The TH-78A can operate in two modes: In SPLIT mode, non-standard offsets (i.e. split frequencies) are supported, but the default offset is not programmable. In SHIFT mode, non-standard offsets are not allowed, but the default offset is programmable. To select the default offset, press F for 1 second, then SHIFT. See p. 30 of the manual for details on changing the default offset.

Toggle CALL button function

Press CALL during power-up. The CALL button can operate in one of two modes. In the default mode (CALLSW), it switches between the call channel and the last memory channel (if in memory recall mode) or last frequency (if in VFO mode). After toggling the CALL button functionality (VMC), it will switch from the VFO to the last memory channel and then back to the

CALL channel.

Observations on post-mod performance

Rich Garcia (n2czf@wt3v.nj.usa) observes "all original functions have maintained the same which is great. Aircraft band which was accessible before the mod remains with the same characteristics. It seems that VHF-High band has improved a bit on sensivity where it was dead as a dog before the mod (above 155.000MHz) but the 162.000 MHz band where weather radio is is still a bit deaf for reception at any distance but about 20 Miles. This depends on your (or my) terrain and transmitter output power.

"On UHF all public safety frequencies up to about 500 MHz seem to come in well but sensivity greatly drops from there (we really can't ask for more). Frequencies can be programed in up to the 920MHz ham band but I have no way of measuring sensivity. 800MHz works but the signals are very weak, you must be near the transmitter for reception. Assuming you are in the town or city where the transmissions originate it should work.

"Transmit is enabled up to and incl. 500MHz but after testing this on a frequency counter I find that a signal is only generated to about 490 MHz, even though the trans. LED shows output in the higher frequencies.

"Crossband repeat seems to work fine but the audio is unacceptable for use, BE AWARE the radio gets HOT! Prolonged use or use on a busy frequency would not be recommended. Also remember this is a dual band HT please use a proper antenna while in this mode to avoid a high SWR, we should all know better... Right?"

Someone else said:

"I found that marine weather reports at 162.40MHz in my area were received much better on the SUB-VHF band, than on the VHF band...

"If you are having problems with intermod, try switching bands (i.e. using the SUB-VHF band rather than the VHF band.)"

Cloning

The TH-78a's memory can be copied from one TH-78a to another TH-78a entirely through radio waves "over the air" (i.e. without cables or other special equipment). Theoretically, this could be done via repeaters, although I've never heard it done. Allegedly this requires a mod that includes removal of D5 or D6, but I haven't researched it.

Cloning is a real boon to groups that want a bunch of radios to contain the same memories, such as amateur radio clubs, search and rescue units, and people too lazy to program their radios. Of course, given that the ME-1 memory expansion unit has 250 memories, laziness is understandable :-)

(1) Set both radios to the same frequency.

(2) Activate both radios by pressing the '0' key while turning the power on. The radios will display the word "clone".

(3) Now, click the PTT button of the "master" radio. The radio will transmit in the economy low power mode. This may take about 4 minutes for fifty channels, or 20 minutes for the 250-memory ME-1. When the data has been transferred, both radios will revert back to their original frequency. (It is recommended that a dummy load be used to prevent unwanted interference.)

(4) Turn both radios off and then on again. The slave is now a mirror-image of the master radio.

Cellular Telephones

Cellular Phones operate at (tx) 824.040 - 848.970 (rx) 869.040 - 893.970, within reach of your modified TH-78a. The increments are, however, every 30kHz; the TH-78a will only increment in 25kHz steps at this frequency range, so the exact cellular frequency cannot be tuned in (most of the time).

Battery life on the TH-78A

wd6cmu@netcom.com (Eric Williams) says:

Some people have complained about the battery life on the TH-78A. I came up with these tips by checking out the power consumption under various configurations. In the case of power-saver mode, figuring out the average current with my DVM was impossible, so I ran the radio on a large capacitor and timed how long it took to die. These tips won't solve everything, but they might help.

The rig draws close to 2ma even with the power turned off, so don't leave the rig off with the battery installed for several days and expect full capacity to be maintained.

If you're only using one of the bands, shut down the other to extend your battery's life -- current consumption with the squelch closed is cut by almost a third.

If you're monitoring two frequencies on the same band, use the f2 button to receive both simultaneously rather than scanning between them -- the battery saver with two receivers will use about half the current of one receiver that is scanning.

You can make up a battery pack by putting nickel metal hydride AA cells in a BT-8 battery holder. A small strip of aluminum from the positive battery terminal to the depression in the top of the case will allow you to recharge the pack inside the rig. This will give you 1000mah capacity without enlarging the size of the radio, and NiMH cells have no memory effect. (But they *are* expensive.)

Customizing the start-up message

William_A._Kirsanoff@smtpgty.anatcp.rockwell.com says:

Just in case you are doing a message write, don't pick slot '0', that would change your start-up message (default is "TH-78A", mine is "KD6MCI" :-)) You can then crack open the manual and read up on how these features work. I use the autodialer regularly. I don't have much use for the message memory other than the start-up trick though.

TH-78a loses the call channel CTCSS tone

George_Lin@mindlink.bc.ca says:
> Michael Sattler writes (regarding George's comments):
>
> Can you come up with an easy procedure for the readers of the guide
> to check whether their particular TH-78a loses the call channel tone?
> (I want to hear what you do, rather than make something up.)

Sure.

Go to the oscillator on the right (UHF oscillator). Select a UHF frequency on the VFO. Set the CTCSS tone frequency to some arbitrary number, say, 94.8 Hz. Turn on the CTCSS. Save the whole thing under the call channel for UHF. Select another UHF frequency. Select another CTCSS tone. Turn the subaudible tone on and save it under a spare memory channel. Go back to the call channel and check the tone frequency.

Stuff that didn't fit anywhere else

"I've had one report that the TH-78A is capable of in-band full duplex operation. I've been unable to repeat this on my unit, which only has the CAP/MARS mod perform. Confirmation of this feature would be appreciated."

Game Mode

ORIGIN: aviator@athena.mit.edu (who no longer exists), who credits james@brokaw.lcs.mit.edu for "much of this".

To enter the game mode press M and PTT during power-up. Be careful not to accidentally reset the memory, which happens with M + power-up. (Don't freak; you'll see the same "all screen items lit" when entering game mode as when you reset memory.) To exit the game mode at any time, press the LAMP key. The volume, lamp, or frequency settings can't be changed while in game mode.

The top part of the display will show "H.00", which represents the high score. The lower part shows a scrolling message, "PRESS ANY KEY". Pushing any key starts a "Follow Simon" type game. The display will briefly show one of the characters '1', '2', '3', or 'F'. Press the corresponding key. The game consists of repeating the displayed character sequence, which

increases by one character each round.

After you "win" the Simon memory game by getting correctly entering a sequence of twenty characters, the next game is a draw poker game.

The way it works is that you choose your bet (from 1 to 10) by pressing '2' to increment the bet and '5' to decrement the bet. Then, press 'F' to deal the five cards. The face value of the cards is displayed, and the suits can be seen at any time by holding down the PTT key. Any number of cards may be discarded, and to select (or deselect) a card for discarding, press the keys '1', '2', '3', '4', or '5'. If a card is selected for discard, it is displayed "face-down".

Press 'F' again to draw new cards. Your new cards will be displayed, and then if your hand is 2-pair or better, the screen will show the rank of your hand on the left (2P for 2-pair, 4K for four-of-a-kind, etc.). On the right the pay-off for that hand will be displayed. Your bet is multiplied by the pay-off factor,and the resulting pile of cash is displayed in the right hand side of the upper screen. (The left-hand side of the upper screen contains your table stakes, which are initially 100 coins from winning the Simon game.)

If you win the poker hand, pressing any key steps into the next stage. If you lose the poker hand, your bet is deducted from your stakes and you are asked to start another poker hand. In the next stage, you are asked "TRYB/S" which means, "Do you want to try double-or-nothing in a guessing game for Big or Small cards?" Press 'F' for yes, press TONE for no. If you say no, your winnings are credited into your stakes and you are asked to start another poker hand. If you say yes, then a single shuffling/incrementing card is displayed on the left, and three stars are displayed on the right. You have to choose to go for either BIG or SMALL, by pressing '2' or '5'. You can keep pressing '2' and '5' to change your mind. When you are ready, you must try to hit the 'F' key to stop the rotating card display, and the card will show, and you will either win, lose, or draw. If you draw, you have to play big/small again, I think. If you lose, your winnings are gone and you can play poker again. If you win, your winnings double and you are asked whether you want to play big/small again.

The payoffs on the poker are set against you, odds-wise; the double-or-nothing game includes a draw, so the odds are against the player there unless you can time hitting the 'F' key to win more than half the rounds. I haven't managed to do this, so I don't know if there is anything beyond this, all I know is that when the table stakes are exhausted, you go back to playing Simon again.

19. Tech Manuals for Midland 13-516 Transceiver Needed

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-03 20:31:31 UTC
From: salhany@bmerha9e.bnr.ca
Message-ID: <2g9vb3$rvm@bmerha64.bnr.ca>
Source record: 228496

I am looking for tech manuals/information for the Midland 13-516
Transceiver mentioned above.

If you have any information regarding this tranceiver or know where
I can try, please send me a note. I have been looking for this
information for some time... Any help would be appreciated.

Thanks in advance...

Wayne Salhany
salhany@bnr.ca

20. DJ-F1T Buttons Fixed

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-03 21:07:50 UTC
From: eri316@tijc02.uucp
Message-ID: <1994Jan3.210750.23843@tijc02.uucp>
Source record: 228497

Over the holidays, I found the time to dig into my DJ-F1T in an attempt to make the PO button work reliably again. No small job--and not one recommended for the faint of heart! The PO button (and it's buddies, SCAN, V/M, and CALL, are as deep as you can go inside a DJ-F1T. Tools needed: jeweler's Phillips screwdriver, needlenose (to bend the LCD retainer lugs), tweezers to handle those tiny screws, a smallish soldering iron and desoldering tool (to unsolder the PTT switch assembly and the speaker).

With all laid bare, I found traces of liquid residue (no doubt Pepsi, given our tastes) which I cleaned off with alcohol from the suspect switch contacts (PWB traces which get shorted by a conductive button).

After reassembly, the radio still worked (which was not too certain for awhile there) and the PO switch is working perfectly now.

21. R&R associates keyer kit

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-03 23:53:30 UTC
From: ag821@yfn.ysu.edu
Message-ID: <2gab5q$r8d@news.ysu.edu>
Source record: 228498

quick follow up on R&R associates and the Cmos Super Keyer II.

I got Dick Rathburns number and gave him a call. I re-explained everything I had said in the letter. The guy has a mouth like a sewer and sure doesn't want anything to do with any problems.. just told me it wasn't his problem and I should send the chip to the author of the original article. I explained I didn't buy the kit from the author, and didn't even know him and felt the problem should be handled by the company selling the kits. He didn't have anything nice to say and continued to use short words.

Well, on the bright side, I have found all the other people I have dealt with in this hobby to be the opposite.

Source record: 228500

blood@austin.ibm.com wrote:

: Anyone know where the mods for this HT can be found?

The Complete (and Mostly Accurate) Guide to Undocumented Features
of the Kenwood TH-78a Handheld Transceiver

28 Dec 1993

PURPOSE: This file contains descriptions of all the undocumented features
of the TH-78a I could find as of this date. It doesn't attempt to explain
anything covered in the manual, but it does pass on pointers to interesting
uses of documented features (such as using message write 0 as a start-up
screen).

VALIDITY: This file supercedes the following: th78a-0.mod, th78a-1.mod,
th78a-2.mod, th78a-complete.mod, th78a-new.mod, th78a-warn.mod. I've run
this file by the authors of those mod files, where I could find them. Be
assured that you have the best information about the TH-78a we could put
together.

WARNING: This information is furnished without guarantee or warranty.
Working with surface-mount diodes is delicate work. Or as Eric Williams
(wd6cmu@netcom.com) so eloquently says "Lawyer bait: If you screw up your
radio, it's your own damn fault, don't blame me. (But it worked on mine.)"
These modifications (mods) may or may not work on your particular unit
according to Kenwood. I certainly accept no responsibility for your
handiwork or your transmitting on frequencies that you're not allowed to.
You may have good reasons to transmit outside of ham bands as I do during
search and rescue work (typically on CLEMARS, NLEMARS, and CALCOORD).

ACCURACY: Please mail me (Michael Sattler, KE6DZF) at msattler@jungle.com
if you see any omissions or mistakes. Make sure to pass along the date of the version
you're seeing (it's just under the title).

THANKS: Thanks be to all those who helped me, including
George_Lin@mindlink.bc.ca, Brendan_Hoar@notes.pw.com, rfc@allegra.att.com,
wd6cmu@netcom.com, elendir@enst.fr, nyu@flute.aix.calpoly.edu

AVAILABILITY: I'll attempt to have the latest version of this file (named
"th78a.kensho.mod") placed at the following mod servers:

Server Directory
---
ham.eetech.mcgill.ca /pub/ham-radio/mods

(aka atlas.eetech.mcgill.ca)
bubba.business.uwo.ca /mods/
garfield.catt.ncsu.edu /pub/hamradio/HAM_MODS
kilroy.jpl.nasa.gov /pub/hamradio/Mods
ftp.geo.brown.edu /pub/hamradio/rigmods
(no longer accepts anons)

And one mail server:

pcserver@novell.business.uwo.ca
examples of main body email requests are as follows:
HELP
SENDME RADIO MODS
SENDME TH215 MODS
SENDME ALLBAND MODS

SCOPE: Ever since this guide has been loosed on the net, every so often
[someone] asks:

>Would you happen to know a similar list for the Kenwood TH-77A (next one
>back) Hand Held or the TM-721A (way back) mobile radio?

I would not know about radios other than the one I own, sorry. I compiled
this guide from old mod notes, tidbits I found on the net, and personal
experience. I'm guessing that there are others out there that have done
the same for their radios; I suggest that you look through all the mod
servers. (If you know of other mod servers, please let me know.)

Game Mode

What is a "new" TH-78a?

Kenwood says that any TH-78a with a serial number greater than 405xxx is considered a "new" TH-78a. I've not authoritatively determined the difference between the old and new models, but the mods differ, so it's worthwhile to check the serial number. The ARTSCI 5A techmod book calls this the "Later Model (with green jumpers)". I use the terms "early model" and "late model" throughout this document.

William_A._Kirsanoff@smtpgty.anatcp.rock says:

"I can tell you the difference between an "old" and "new" TH-78A. The "old" 78As had a fault in the microprocessor resulting in an inability to store a pl tone in the call channels (and possibly some other bazaarities). People who complained got the new processor installed by Kenwood when it became available (there are actually 2 microprocessors in the HT, I think the one changed is IC 5, mine has a paper label pasted over it). It seems they also added the jumpers on the programming diodes, probably to keep hams from using their soldering irons on the SMC diodes while making mods. :-) When my "old" unit was upgraded to the new processor, my mods from removing the diodes remained in place."

Basics of modifying the Kenwood TH-78a

To open the radio, follow the instructions on page 64 of the manual. (Unscrew four screws and break apart the radio halves.) The two TX/RX busy indicators (LEDs) have rubber seals placed over them. These have a tendency to fall off when opening or closing the radio.

All position references in this document assume that you are looking at the CPU board with the rotary encoders and TX/RX busy indicators at the top. If you have installed the ME-1 EEPROM, I recommend that you temporarily remove it to facilitate access to the diodes.

You'll see a brass shield about one centimeter square covering the processor chip and the surface-mount diodes on the back half of the radio. De-solder the shield's four corners and remove it. (I used an right angle surgical tweezers in conjunction with the pin-point soldering iron to lift the brass shield.)

Uncovered are the processor (which we ignore) and six surface-mount diodes, numbered sequentially from one through six (D1 - D6), top to bottom. These are about one millimeter wide; remember the note about skill and finesse. New model radios also have two large loops of green wire, numbered one through two (W1 - W2), bottom to top.

You'll need a pinpoint-tip soldering iron and some braid to wick away the solder before you lift out the diode. Alternatively, Rich Garcia (n2czf@wt3v.nj.usa) suggests leaving the diode in place. "I found if you

BRIEFLY touch the iron to the right side lead while gently pulling up on
the SMC diode it should completely come off without needing to apply heat
to the other side and further risk board damage."

After you perform some or all of the mods listed below, replace the brass
shield and re-assemble the radio. Then reset the processor (as documented)
and re-enter any frequencies into memory.

Potential case design flaw

>From wb1e@k1rqg.me.usa.na (which no longer exists):

In the course of performing mods on my Kenwood TH-78a dual band handheld,
I've discovered a potential flaw in the case design. While handling my walkie
one day (after the mods were done), the display went blank and I could not
turn the radio back on. With the radio split in half again, I could turn the
radio back on but discovered all the memories were erased. The cause turned
out to be some component pins on the front face coming in contact with the
square bodies of the two volume/channel/squelch switches, when the case is
screwed back together snuggly. I placed small strips of electrical tape on
the sides of the switches to insulate, and reassembled; problem solved. Now
I have to reprogram the darn thing....

molson@bml4380.cpg.cdc.com (Mark Olson) said:

There is a warning on some of the rig mod bulletin boards about this. The
problem is that pins on the back side of the PCB that is mounted on the
front half of the TH78 can come into contact with the volume control
housings mounted on the PCB on the other half of the unit. My radio had
this problem until I put electrical tape across these housings. Symptoms
were: Display blanking momentarily and the unit power cycling, sometimes
causing memory erase, when pressure was applied to the front of the unit or
to the volume controls. I originally thought that it was a loose battery
connection...

Open up the radio and you will see what I mean... Believe me, the fix
is simple and it works.

C-17 design flaw

William_A._Kirsanoff@smtpgty.anatcp.rockwell.COM said:

"The 78A WILL lose C-17 on the control board if dropped, period. This
causes loss on receive audio on the left-hand side of the radio. The
solder pads for that cap are not big enough. If you find the need to
replace C-17, use a gap-fill cyanoacrylate glue like Zap-A-Gap (tm)
to increase the device footprint. I have learned the hard way.
Otherwise, I have found it to be a fine radio. My only problems have
been related to the C-17 issue and attempts to rectify it. Had I
been given the above advice, it would have been a one-time only
issue. As it is, I took out one of the microprocessors yesterday

looking for a bad solder joint that was induced by my attempt to
solve the C-17 problem (sigh). This radio gets a lot of use and
a lot of travel. C-17 is the only thing that I have broken with
the case closed. :-)"

Mutually exclusive mods

Some of these mods are reputed to be mutually exclusive. You must choose
one of the following levels of performance:

The "beyond MARS" mod - gets you the widest tx/rx
The "MARS/CAPS" mod - halfway there
The "extended receive" mod - more of a good thing

plus

The "cross-band repeat" mod - a repeater that weighs almost nothing

There is no mods that manipulate diodes D1 or D2 (I've seen it suggested
elsewhere that this is toggles the USA/Europe-ness).

Brendan_Hoar@notes.pw.com suggests:

"I think removal of D1 causes "Forced Channelized Mode", at least on the
"new" radios. If you put both VHF and UHF memories into a TH78A without
D1 and
power on, you are stuck in channel mode until you do a full memory reset.
Remember, you can't add frequencies or do any tuning in channel mode.

If you think about it, you'll want to be very careful not to let D1's circut
become an open circut."

The "beyond MARS" mod:

This mod provides the widest possible range of tx/rx. The mother of all
TH-78a mods.

To mod (early model): remove diode D5 only.

To mod (late model): remove diode D3 and cut wire W1. D5 has priority over
D3, so if you've already made the mods for the old model (which included
the removal of D5) you must resolder D3 into D5.

Yields RX 50-179.995, TX 136-179.995, RX 300-399.995, RX 400-511.995, TX
400-511.995, RX 800-999.995.

To use: buttons operate the same way as described in the "extended receive"
mod, except that you can transmit on a much wider range.

NOTE TO ALL: I haven't been able to verify the actual operation of my radio
on all these freqs. Kenwood talks about the difference between the
"dialable" range and the operating range. I'd like to come up with a chart
for each level of mod that combines the above and the two following

offerings. Help me, please.

* *

Left VFO Right VFO
50.000-85.2x (with beep) 50.000-110.xxx (with beep)
85.2x-179.995 110.xxx-179.995
300.00-399.975

400-511.99 SUB-UHF 400-511.99

400-511.99 UHF 400-511.99
900-949.9875 " (NA)
50-179.995 (FM) SUB-VHF 136-179.995

The "CAP/MARS" mod:

This doesn't cover as much room as the beyond MARS mod does, but may be more appropriate for those who use the CAP or MARS frequencies.

To mod (both early and late models): remove D6 only.

Yields RX 118-173.995, TX 142-151.995, RX 400-511.995, TX 425-454.995.

The "extended receive" mod:

This is the mod that's usually given to hams to pacify them (the beyond MARS mod is closely guarded).

To mod (both early and late models): remove diode D5.

To use: press 'F' for one second and then pressing the Band button will switch the UHF VFO to a 800-999.995 MHz band and the VHF VFO to a 300-399.995 MHz band. The regular VHF VFO can now receive down to 50 Mhz.

The "cross-band repeat" mod:

Allows you to... (WHAT!?!)

To mod: remove diode D4.

To use: press 'F' for one second, then '0'. Repeat to disable. The MHz dot will flash when in repeater mode.

Toggle SHIFT button function

Press SHIFT during power-up This is described in the manual, but the documentation is not complete. The TH-78A can operate in two modes: In SPLIT mode, non-standard offsets (i.e. split frequencies) are supported, but the default offset is not programmable. In SHIFT mode, non-standard offsets are not allowed, but the default offset is programmable. To select the default offset, press F for 1 second, then SHIFT. See p. 30 of the manual for details on changing the default offset.

Toggle CALL button function

Press CALL during power-up. The CALL button can operate in one of two modes. In the default mode (CALLSW), it switches between the call channel and the last memory channel (if in memory recall mode) or last frequency (if in VFO mode). After toggling the CALL button functionality (VMC), it will switch from the VFO to the last memory channel and then back to the CALL channel.

Observations on post-mod performance

Rich Garcia (n2czf@wt3v.nj.usa) observes "all original functions have maintained the same which is great. Aircraft band which was accessible before the mod remains with the same characteristics. It seems that VHF-High band has improved a bit on sensivity where it was dead as a dog before the mod (above 155.000MHz) but the 162.000 MHz band where weather radio is is still a bit deaf for reception at any distance but about 20 Miles. This depends on your (or my) terrain and transmitter output power.

"On UHF all public safety frequencies up to about 500 MHz seem to come in well but sensivity greatly drops from there (we really can't ask for more). Frequencies can be programed in up to the 920MHz ham band but I have no way of measuring sensivity. 800MHz works but the signals are very weak, you must be near the transmitter for reception. Assuming you are in the town or city where the transmissions originate it should work.

"Transmit is enabled up to and incl. 500MHz but after testing this on a frequency counter I find that a signal is only generated to about 490 MHz, even though the trans. LED shows output in the higher frequencies.

"Crossband repeat seems to work fine but the audio is unacceptable for use, BE AWARE the radio gets HOT! Prolonged use or use on a busy frequency would not be recommended. Also remember this is a dual band HT please use a proper antenna while in this mode to avoid a high SWR, we should all know better... Right?"

Someone else said:

"I found that marine weather reports at 162.40MHz in my area were received much better on the SUB-VHF band, than on the VHF band...

"If you are having problems with intermod, try switching bands (i.e. using the SUB-VHF band rather than the VHF band.)"

Cloning

The TH-78a's memory can be copied from one TH-78a to another TH-78a entirely through radio waves "over the air" (i.e. without cables or other special equipment). Theoretically, this could be done via repeaters, although I've never heard it done. Allegedly this requires a mod that includes removal of D5 or D6, but I haven't researched it.

Cloning is a real boon to groups that want a bunch of radios to contain the same memories, such as amateur radio clubs, search and rescue units, and people too lazy to program their radios. Of course, given that the ME-1 memory expansion unit has 250 memories, laziness is understandable :-)

(1) Set both radios to the same frequency.

(2) Activate both radios by pressing the '0' key while turning the power on. The radios will display the word "clone".

(3) Now, click the PTT button of the "master" radio. The radio will transmit in the economy low power mode. This may take about 4 minutes for fifty channels, or 20 minutes for the 250-memory ME-1. When the data has been transferred, both radios will revert back to their original frequency. (It is recommended that a dummy load be used to prevent unwanted interference.)

(4) Turn both radios off and then on again. The slave is now a mirror-image of the master radio.

Cellular Telephones

Cellular phones operate at (tx) 824.040 - 848.970 (rx) 869.040 - 893.970, within reach of your modified TH-78a. The increments are, however, every 30kHz; the TH-78a will only increment in 25kHz steps at this frequency range, so the exact cellular frequency cannot be tuned in (most of the time).

Battery life on the TH-78A

wd6cmu@netcom.com (Eric Williams) says:

Some people have complained about the battery life on the TH-78A. I came up with these tips by checking out the power consumption under various configurations. In the case of power-saver mode, figuring out the average current with my DVM was impossible, so I ran the radio on a large capacitor and timed how long it took to die. These tips won't solve everything, but they might help.

The rig draws close to 2ma even with the power turned off, so don't leave the rig off with the battery installed for several days and expect full

capacity to be maintained.

If you're only using one of the bands, shut down the other to extend your battery's life -- current consumption with the squelch closed is cut by almost a third.

If you're monitoring two frequencies on the same band, use the f2 button to receive both simultaneously rather than scanning between them -- the battery saver with two receivers will use about half the current of one receiver that is scanning.

You can make up a battery pack by putting nickel metal hydride AA cells in a BT-8 battery holder. A small strip of aluminum from the positive battery terminal to the depression in the top of the case will allow you to recharge the pack inside the rig. This will give you 1000mah capacity without enlarging the size of the radio, and NiMH cells have no memory effect. (But they *are* expensive.)

The TH-78A (USA) vs. the TH-78E (European/Japanese)

CTCSS:

Eric Williams (wd6cmu@netcom.com) reminds us that:

>The manual says that the CTCSS module is an option on the
>European model, but standard on the U.S. one.

Vince (elendir@enst.fr) replies:

>That's ... because [the French] repeaters are activated by
>a 1750-hertz tone. If I intend to go to US this summer,
>must I buy the CTCSS module ?

biocca@csg.lbl.gov (Alan K Biocca, WB6ZQZ) says (and I paraphrase):

>While it varies geographically, where I am (Lawrence Berkeley
>Laboratory, California) very few 2-meter repeaters require CTCSS
>tones, most 440 MHz repeaters do. Many of those that do are closed
>anyway. You can probably get by without them.

gsm@mendelson.com (Geoffrey S. Mendelson, N3OWJ) tells us:

>It depends on where you are. In the Philadelphia area most of the
>open 440 MHz repeaters use CTCSS and none of the 2-meter ones do.
>At least one uses CTCSS for remote inputs.
>
>About 60 miles away in southern New Jersey, all of the 2m and 440
>repeaters use CTCSS.

Frequency range differences:

Someone (I've forgotten who) suggested:

>Um, I'm pretty sure that the unmodified UHF TX range is different.

Kenneth E. Harker (kharker@bnr.ca) wrote:

>These are the VHF - UHF bands authorized in France :
>
>50.2 to 51.2 with a special authorization.
>144 to 146
>430 to 440 (shared band)

Whereupon Lawrence "The Dreamer" Chen (dreamer@lhaven.UUmh.Ab.Ca) said:

>In North America the authorized bands are:
>
>50-54
>144-148
>220-225 (222-225 in US and soon to be Canada)
>420-450 (420-430 is only by special permission) and its a shared band.
>
>I would guess that the TH-78E only does 144-146 and 430-440 while
>the TH-78A does 144-148 and 440-450.

torsten@rnivh.rni.sub.org (Torsten Leibold) summarized for us:

>Yep, you're right. The A version is the American version and
>the E stands for Europe. The E version does 144-146 MHz and
>430-440 MHz without modifications. (I guess there are some
>secret codes to switch it to the "A"-bands, but I don't know
>them).

I don't know of any "secret codes", but I'd heard that D1 toggled
between 'A' and 'E' performance. Unverified. -- msattler

Customizing the start-up message

William_A._Kirsanoff@smtpgty.anatcp.rockwell.com says:

Just in case you are doing a message write, don't pick slot '0', that would
change your start-up message (default is "TH-78A", mine is "KD6MCI" :-))
You can then crack open the manual and read up on how these features work.
I use the autodialer regularly. I don't have much use for the message
memory other than the start-up trick though.

TH-78a loses the call channel CTCSS tone

George_Lin@mindlink.bc.ca says:
> Michael Sattler writes (regarding George's comments):
>
> Can you come up with an easy procedure for the readers of the guide
> to check whether their particular TH-78a loses the call channel tone?
> (I want to hear what you do, rather than make something up.)

Sure.

Go to the oscillator on the right (UHF oscillator). Select a UHF frequency on the VFO. Set the CTCSS tone frequency to some arbitrary number, say, 94.8 Hz. Turn on the CTCSS. Save the whole thing under the call channel for UHF. Select another UHF frequency. Select another CTCSS tone. Turn the subaudible tone on and save it under a spare memory channel. Go back to the call channel and check the tone frequency.

Stuff that didn't fit anywhere else

Early on, msattler@netcom.com (Michael Sattler, KE6DZF) mentioned:

>I've had one report that the TH-78A is capable of in-band full duplex
>operation. I've been unable to repeat this on my unit, which only has the
>CAP/MARS mod perform. Confirmation of this feature would be appreciated.

nyu@flute.aix.calpoly.edu (Neal, KD6HPG) replied:

>My friend (N6RNF) has a "early" model radio and it was capable of doing
>in-band full duplex. I have a "later" model of the TH-78A and I can't
>get it to work on mine. My friend's radio has the beyond MARS mod.

Game Mode

ORIGIN: aviator@athena.mit.edu (who no longer exists), who credits james@brokaw.lcs.mit.edu for "much of this".

To enter the game mode press M and PTT during power-up. Be careful not to accidentally reset the memory, which happens with M + power-up. (Don't freak; you'll see the same "all screen items lit" when entering game mode as when you reset memory.) To exit the game mode at any time, press the LAMP key. The volume, lamp, or frequency settings can't be changed while in game mode.

The top part of the display will show "H.00", which represents the high score. The lower part shows a scrolling message, "PRESS ANY KEY". Pushing any key starts a "Follow Simon" type game. The display will briefly show one of the characters '1', '2', '3', or 'F'. Press the corresponding key. The game consists of repeating the displayed character sequence, which increases by one character each round.

After you "win" the Simon memory game by getting correctly entering a sequence of twenty characters, the next game is a draw poker game.

The way it works is that you choose your bet (from 1 to 10) by pressing '2' to increment the bet and '5' to decrement the bet. Then, press 'F' to deal the five cards. The face value of the cards is displayed, and the suits can be seen at any time by holding down the PTT key. Any number of cards may be discarded, and to select (or deselect) a card for discarding, press the keys '1', '2', '3', '4', or '5'. If a card is selected for discard, it is displayed "face-down".

Press 'F' again to draw new cards. Your new cards will be displayed, and then if your hand is 2-pair or better, the screen will show the rank of

your hand on the left (2P for 2-pair, 4K for four-of-a-kind, etc.). On the right the pay-off for that hand will be displayed. Your bet is multiplied by the pay-off factor,and the resulting pile of cash is displayed in the right hand side of the upper screen. (The left-hand side of the upper screen contains your table stakes, which are initially 100 coins from winning the Simon game.)

If you win the poker hand, pressing any key steps into the next stage. If you lose the poker hand, your bet is deducted from your stakes and you are asked to start another poker hand. In the next stage, you are asked "TRYB/S" which means, "Do you want to try double-or-nothing in a guessing game for Big or Small cards?" Press 'F' for yes, press TONE for no. If you say no, your winnings are credited into your stakes and you are asked to start another poker hand. If you say yes, then a single shuffling/incrementing card is displayed on the left, and three stars are displayed on the right. You have to choose to go for either BIG or SMALL, by pressing '2' or '5'. You can keep pressing '2' and '5' to change your mind. When you are ready, you must try to hit the 'F' key to stop the rotating card display, and the card will show, and you will either win, lose, or draw. If you draw, you have to play big/small again, I think. If you lose, your winnings are gone and you can play poker again. If you win, your winnings double and you are asked whether you want to play big/small again.

The payoffs on the poker are set against you, odds-wise; the double-or-nothing game includes a draw, so the odds are against the player there unless you can time hitting the 'F' key to win more than half the rounds. I haven't managed to do this, so I don't know if there is anything beyond this, all I know is that when the table stakes are exhausted, you go back to playing Simon again.

This is the end of The Complete (and Mostly Accurate) Guide to Undocumented Features of the Kenwood TH-78a Handheld Transceiver.

23. MRF422 power transistors

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-04 11:50:10 UTC
From: rick@tanasi.gg.utk.edu
Message-ID: <940004.125010.rick@williams>
Source record: 228504

The rf power transistors, a pair of MRF422's, in my Yaesu FT-980
are blown. Yaesu gets $94.90 each for them. RF Parts lists
them for $38 each or $92.50 for a matched pair. Is this a
good price, or can anyone direct me to a cheaper supplier?

Correction! I was thinking about my TM-741A, not a 731, when I wrote my Dec. 30 item below. (I had a TM-731A at one time, so the number sounds very familiar; I got the 741 later.) Sorry about my error!

In article <2fvcr6$grc@tymix.Tymnet.COM>, drawson@Tymnet.com (Dick Rawson) writes:

Try calling a Motorola distributor like Hamilton/Hallmark (800 directory assitance). RF Parts stocks a lot of parts while the distributors don't seem to, but it is worth a try.

Mail to you bounced, so,...

Let me know if you don't get an answer -- I can hook you up with an
old friend that I used to work with at Heathkit who has one of
everything, but I don't like to bother him too much.

29. Alinco DJ580 Battery Woes

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-04 22:27:25 UTC
From: brown_mi@eisner.decus.org
Message-ID: <1994Jan4.172725.1780@eisner>
Source record: 228511

I have an Alinco DJ580T that has been in fine service for over a year. I have two battery packs, one the standard 7.2V 700mah battery, and the other a 7.2V 1500 mah battery. Naturally, the 1500 mah goes longer than the 700. However recently, it seems that the 700 can not last more than a day (8 hours) on receive with little tx. The 1500 lasts about 5 times as long. Can anyone give me a feel for how long their dj580 batteries are lasting?

The second question will surely stir up some discussion. What is the optimal charging time for my batteries? I am using the standard wall charger (the dinky transformer that trickle charges the batteries). I have been told to leave the batteries in there for only 15 hours, while others tell me that two to three days is more like it. My old Motorola "brick" (HT220) was happy with weeks on trickle, as long as I drained the battery completely when I used it. I am a bit confused.

Signed,
My Battery's Got Me Down

Message-ID: <1994Jan5.093239.1@cmu.unige.ch>
Source record: 228512

Hi,
I live in Switzerland and I'm planning a travel to New York
in January.
I'm looking for a little transmitter-receiver Yeasu used in
mountaineering (help messages) and aeronautic (paragliding).
I need frequency from 113 to 170 MHz.

1) Does it exist a Yeasu pocket model which cover all this band ?

2) What are the prices in US dollars ?

3) How many cost the Yaesu FT-26 or FT-2006 ?

4) Do you know a good shop which sale them in Manhattan ?

Best regards,
Christophe

35. MFJ QRP rigs - opinions/flames wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-05 11:29:33 UTC
From: bencze@isl.stanford.edu
Message-ID: <BENCZE.94Jan5112933@isl.stanford.edu>
Source record: 228520

Howdy All,

I'm thinking of picking up a MFJ 90xx series QRP rig, and would like to hear any users (or former users) opinions of the rigs, especially stuff you *don't* like about them. They seem to have a fairly large following, but that be a side effect of MFJ's name recognition and advertising resources. Please send any comments to me by direct e-mail and I'll summarize to the group.

Also, if you had to pick any one band to operate QRP on, what would it be? Assume the antenna would have to be a simple dipole (or shortened dipole) for an apartment-dweller -- my current state.

Thanks much and I look forward to your net.wisdom!

72/3,
Bill, KD6TOB

36. Kenwood/Trio's e-mail address??Help on TR7800 final module wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-05 12:51:33 UTC
From: rkwdp@puknet.puk.ac.za
Message-ID: <rkwdp.99@puknet.puk.ac.za>
Source record: 228513

Dear Hams

A fellow ham in town who doesn't have access to internet, etc. asked me to post this question here. His Kenwood TR7800 2m tranceiver is giving problems on the output - it cuts out after a few minutes. He was told that it is the final module of the rig is sick and must be replaced. According to Kenwood's agents in South Africa, this model is no longer available and they will not be able to get hold of a new module for this rig as it was discontinued.

We want to get hold of Kenwood/Trio Corporation in USA or Japan to find this out for ourselves. I wonder if anyone has got an e-mail address for any of the companies in USA or Japan?

Your help will be appreciated. Replies to rkwdp@puknet.puk.ac.za or rkwdp@pukvm1.puk.ac.za

I'm thinking of perhaps getting MFJ's little 40 meter QRP rig. Do YOU
have one and would care to comment on it's performance?

Please E-mail. andy@clark.net

Thanks! -K4ADL

38. MFJ 40 meter

Newsgroup: rec.radio.amateur.equipment

I have the MFJ QRP rigs for 20,30,40. I had one of the original 20 meter rigs and that is what go me into QRP.

You can pick them up used for about 100-125.. great buy. The rig's receiver works well. the rig puts out about 4 watts and does a great job. I think the relay for TX/RC is a little noisey. The audio is a little low.. the new models may have fixed that.. and there is a mod you can do on it. but I use it without the mod. .no problems. for 40 meters you will need the optional audio filter... or build your own. a friend built a four position filter from one of the QRP books or maybe QST article and it works great... I didn't need the filter on 20.. but have to have it for 30 and 40. The rig drifts.. everyone I have had does.. but not a big problem.

If you don't like to build, it is a very good way to go.... there are other ways to get into QRP... I recently purchased a Yaesu 301s that does CW/SSB/AM/FSK and puts out very low to aobut 8 watts adjustable on front panel, has a great receiver.. but it is pretty big.. the MFJ is very small and portable and can easily be powered for hours from a small Gel Cell.

Despite the BS that they wrote to you, how many things have warranties longer than 1 year. Most of the electronics that I buy at work have 30-90 day warranties.

I've had great luck with Heathkit (USA), including their sending me some repair parts at no charge years after purchase. True, they were low cost items but the people I dealt with were always very gracious.

Well I had some good experiences with the company. I purchased a HW-9
after teh company jwent out of the kit business. Got it from somehone
who had purchased it at Dayton. I have been able to get replacement
parts very easily from them. They aren't free, but very glad to
be able to just call up and get them shipped right away.

For Sale:
Kenwood TW4000A 25W Dualbander Mobile. Comes with voice read out, tone card, DTMF mike. Also Connected to it is a 5watt CB with microphone. For more information Email me here.. Will check often..
It is an older radio but for its age it is in great condition.. only a minor problem with the voice readout <You cant just push the button, you have to hold it down for the complete readout> I have used it in the car and home for packet and it works great! I hooked mine up to a seperate speaker in the car cause its kind of hard to hear it in a blazer when on the console.. Comes with its own mounting brackets too..
If anyone needs more info let me know I will be checking here often.
Would like to sell it while im home from college on break.
Sorry guys but no trades, they wont accept ham gear for tuition payments :)

One other important item I would like to add. .. I have built about
every QRP kit out and have had 8 or 10 side by side for testing at
a time... even though it ended up that I had some problems with
my Heath because of a defective mixer... and that caused me to
mess some other things up and have to replace a number of coils,
because I played with the adjustement too much and ruinded the cores, I
have no complaints.. of all the QRP kits I have built.. the ONLY
one that will never be for sale is the HW9. For the money, it was by
far the best rig.. has a meter, RIT, front panel power control, built-in
effective narrow filter, plenty of audio power, and mined does 8
bands. The receiver seems to hear about everything my Japanese radio
does, was a pleasure to build.. had an incredible manual and diagrams,
the parts came sorted in order of use and even with my replacing parts,

the whole thing was about $300.

I also have an old frequency counter that I Picked up at a Ham fest
for all I know the thing can be ancient.. I payed $15 for it. The counter
works great and I use it all the time to align rigs.

Says something when the kit you built yourself performs GREAT!

about the opposite of Ramsey.

44. Do UPS Drivers Fix Ham Gear?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-05 21:22:00 UTC
From: andy@clark.net
Message-ID: <2gfb1o$ea@clarknet.clark.net>
Source record: 228522

Couple of weeks ago my Kenwood 331A 220 mobile went bonkers during what turned out to be my last transmission. I couldn't reset the microprocessor; neither the xmit or receive worked... nothing. I played with it for 2 days, using different power sources, antennas, etc, but still the LCD display showed garbage and nothing worked. So I sent it to Kenwood in Virginia Beach, VA. A week later I got a call from them telling me that the rig worked fine, right out of the box. They played with it for 2 days, checked all the specs, and still could find nothing wrong. We concluded, obviously, that the UPS driver must have taken the initiative to repair the unit himself on the trip down to VA Beach.

Unfortunately, I have to pay Kenwood's $25 "nothing-wrong" fee, plus return postage. If the UPS driver fixed my radio, I wish he would have just put it on a northbound truck before it got to Kenwood.

Anyway, I haven't a clue as to what went wrong. Maybe YOU do?

By the way...just as an aside...I am quite delighted with the responsiveness of the Kenwood VA Beach service center, in spite of their "nothing-wrong" minimum charge.

What's your radio worth? You've already saved $100 by going to RF Parts (An excellent source I might add). How much more are you willing to gamble on a pair of (obviously) expensive components?

What's the RF deck worth if you lift a trace changing out that $20 pair you found from some surplus house instead of changing them once?

What's the retail value of the radio, working and not working? If the radio is only worth $20 more working than broken, sell it and buy some thing with a better resale value. If the difference is substantial, put the quality of parts and workmanship into the radio that it deserves.

Bill,
I just bought a MFJ 40M unit off another net.junkie Monday morning.
Should come sometime next week.

They are VERY popular here in the Detroit area. The only real
"complaint" is that they do drift a tad. Other than that, everyone
loves them.

I would suggest you also get a 40 or 80 meter unit. The other bands are
going downhill anyways.

From: partos@larry.larc.nasa.gov
Message-ID: <PARTOS.94Jan6140807@larry.larc.nasa.gov>
Source record: 228531

My solution was to make a simple mount that would fit over the edge of
the rear window. Just take a piece of stainless or aluminum sheet,
around 2"x6", and make a 90 deg. bend 2-3" in from one end; then bend
the long leg back into a U shape to fit over the window edge. Drill a
hole to attach the antenna and tht's it. Works fine.

RF parts will sell you new MOTOROLA transistors at a lower price than
the local Moto sales office. What more would anyone want?
Motorola seems to make it impossible to get parts unless you buy many
more than you'll ever need in your lifetime. Getting one or two of
anything Moto is next to impossible, or can someone steer me to an
outlet that has MHW607-1 modules? RF Parts 'Doesn't handle that line',
but they do have quite a few Moto trannys and modules from other countries.

Well, Galen, when I wanted to order some J310 JFETs, I looked at RF Parts and said "$1.50 each!!" and then called Hamilton/Hallmark and they said "$.34 each". I also wanted some MC145170 PLL chips, which RF Parts doesn't carry. I got these for $7 each at Hamilton/Hallmark. Other than the $50 minimum order, I had no trouble getting these Motorola parts from Hamilton/Hallmark, and they were very helpful.

I've also used RF Parts, and I think they provide a great service by stocking a lot of fairly exotic RF semiconductors, but they aren't the end-all source. Motorola distributors _can_ be a pretty good source of Motorola parts..

Christoph-
Unfortunately there is no such radio available. This is b/c below 136
MHz, VHF is all AM. You could get an ICOM A2 for the air band, and then
get a separate radio for VHF FM 136-174 MHz. I'd recommend the
ICOM
H16. In New York you could go to Barry Electronics on Broadway and
Spring street, just up the block from Canal Jeans. This store will
have all of the equipment you'll need, but they're quite expensive.
If You want something, they will negotiate on price though.

Hello all you usenetters! Got a question for all of you. I have a Kenwood TR-2600A handheld, and would like to know how to open up the receiver on it. I know it is possible, because my elmer has the same radio with an open rcvr. Looked in the mods ftp and found open-transmit mods, but no open-receive mod. Any help would be appreciated. Other than the fact it has no extended coverage, I am very happy with this radio. My only wish is that it put out 5 watts at high power instead of 2.5. :)

Thanks and 73 everyone DE N0YAX -sk-

>tell you about ?

It's been a long time since I've worked on an F1T, but you first have to do
the mods to the radio before you can access the AM band. It's simple - open
up the radio and snip the red and the blue loops of wire on the main board.

56. TNC wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-07 01:18:30 UTC
From: snorris@trumpet.aix.calpoly.edu
Message-ID: <1994Jan07.011830.174485@zeus.aix.calpoly.edu>
Source record: 228534

I am looking for a TNC to use with a Kenwood Th28A handlheld. If anyone out there in netland has one that they would like to get rid of, please drop me some E-mail with the brand, model, condition, and asking price. I would prefer the smallest unit that I could get, but I won't be really picky since this will be my first TNC, and I just want to see what it has to offer. It doesn't have to have all kinds of features, just enough to provide basic functionality. Thanks in advance for any help and/or suggestions.

If you have performed the extended RX mod then...

Go into the VFO mode (hit the V/M button until you see a "V" displayed)
and then press the "B" button. A reversed "A" will appear to the left of
the "V" in the display.

From: henrys@netcom.com
Message-ID: <henrysCJ8u3F.CH5@netcom.com>
Source record: 228536

Has anybody connected a Transverter to a Kenwood TS-430?

I am seriously looking at the Down East 6 Meter Transverter and I
want to use it with my TS-430 in the mobile.

The TS-430 manual has a pin-out for a transverter connector but it
doesnt say a lot about.

Thanks,

Smitty, NA5K

You first have to open the radio and cut a jumper. After that the
B key on the keypad witches you between AM and FM mode when you are
in the VFO. (A little "A" appears on the display when you are in AM
mode.) You can store AM frequencies in the memories, scan through
them, etc..., just like you can do with the FM ones.

Here's the post that I followed when I did the modification to my
radio:

$From: Gary_Thorburn_at_Notes-Gate@sceng.UB.COM
$Newsgroups: rec.radio.amateur.misc
$Subject: Alinco DJ-F1T
$Date: 5 Aug 93 13:38:31 GMT
$Organization: UCSD Usenet Gateway
$Lines: 32
$Message-ID: <9307057445.AA744554311@sceng.UB.com>
$NNTP-Posting-Host: ucsd.edu
$Originator: daemon@ucsd.edu
$
$
$
$ There have been lots of inquiries about this fine, tough little unit
$ lately, so I thought I'd post the MOD for extended xmit and receive.
$ Also, there is a Gordon West audio cassette tape about how to program the
$ DJ-F1T. I got the tape free from a guy at an Alinco booth at a hamfest.
$ It's really helpful.
$ The mod below is exactly what I did, guided by the Gordon West tape:
$
$ Modifying Alinco DJ-F1T: Open the unit by removing battery
$ pack, then the three recessed screws in metal back, and the
$ recessed screw below the Xmit button. With unit face
$ down and Xmit button to the right, hold the battery release
$ button so that metal back will come out as you lift the
$ right edge of the metal back. Imagine that it is hinged on
$ the left. It is NOT hinged here, in fact there are two
$ delicate ribbon cables you must be careful not to damage.
$
$ With the unit open, you will see two wire jumpers, one
$ red, one blue. Cutting the RED wire enables air band
$ receive. Cutting the BLUE wire enables extended transmit.

```
$ I suggest you don't cut the blue wire unless you have good
$ reason to.
$
$ Put the unit back together, and reset it by holding in the
$ function button while you turn it on (say goodbye to anything
$ in memory !) The extended functions are now available.
$
$ The "B" button now toggles AM/FM receive. In AM mode, your
$ frequency range is extended to include the Air band.
$
$ -- Gary KB1AIF thorburn@sceng.ub.com
```

DON'T snip both loops unless you have a real good reason to enable the
extended transmit feature. There is another post under this topic that tells
which one to snip for AM receive. The other one doesn't need to be even
touched unless you are using your HT for MARS or CAP.

I can see that your abilty to read is as impaired as your ability to
use an editor.

I suggested buying parts from RF Parts. (A reputable firm that sells
quality components.) A savings of over $100 from the published Yaesu
price. If you wish to buy junk parts and risk the final assembly in
your radio doing batch testing, that is entirely up to you.

I have been very happy with the Kantronics KPC3 that I purchased last year. It has the basic functionality that is needed to play with packet. It does have its own internal mailbox, but heh, you are probably not going to want to have your rig and tnc on all the time so you will have people send mail to your local club PBBS. The KPC3 works in KISS mode if you want to run NOS (TCP/IP).

The last time I checked the KPC3 is priced new at $109. Not too bad. I use it about once a week with an old Kenwood TR7950, and once in a great while with an Alinco DJ580. Let me know if you have any other questions; you might also post in the digital radio newsgroup.

Oh, and as a fellow EE, I like your tagline!

Ah, you must have had a brush with George Rymciewicz - UPS is rather
proud of this guy - does a lot of those en route repairs. He used to
be a janitor at a lab that I did some time at - we had to get rid of
him, sadly, because he kept screwing up life expectancy tests for
hardware we were trying to perform........

Say "hi" to him for me.

After a bad experience with another company I thought I would relate a good exerience with Yaesu.

I recently purchased and old Yaesu 301S QRP rig. I really am starting to appreciate it. .The case is in good shape but some screws are missing and some special fasteners on the top part of the case. Just for the heck of it I thought I would call the toll free number and see If I could get replacements. I was put through from the operator to parts immediately. I explained to the gentleman what I was looking for. He made sure he understood my request, took my name, address and phone number and said he would reference them in the computer and send them right out in the mail and enclose the bill... no charge on pre-payment.. .sounded good, but I got worried about the cost.. didn't want to spend more than I paid for the radio. The gentleman said, the screws are about 5-10C each and the other parts not much more.. I decided to splurge.

I really enjoyed the way I was treated and sure hope I get the parts.

Have a good weekend.

68. Icom IC-720A - does your return to '100' at band chg?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-08 16:53:59 UTC
From: dgf@netcom.com
Message-ID: <dgfCJBLLz.7rq@netcom.com>
Source record: 228544

I have an old IC-720A which I bought used and fixed up. It works OK
but as one weird habit - if I change bands, the frequency returns to
XX.100 MHz at each band change, rather than preserving the relative
frequency on each band. The only exception is 24 MHz where it returns
to 24.890. Every other radio I've ever used either preserves the lower
part of the frequency across band changes or gives you a separate
frequency per band. I realize this "feature" probably prevents you from
ever transmitting outside the band, but it isn't very handy. Comments?

Thanx! 73 Dave dgf@netcom.com

From: mjr@crl.com
Message-ID: <2gn40f$3q3@crl.crl.com>
Source record: 228545

For one thing it depends upon how old the batteries are, and how many cycles they've been through. I have the same 700mah battery and the 12 volt 700mah (I think its 700 but I don't remember. The 12 volt lasts much longer at low or medium power because Ohm's Law shows that I'm drawing less amps out of the battery at 12 volts to get the same output power on the radio... Off the subject though.

My 7.5 volt battery lasts maybe two days of average use (say 12 hours) with little tx. The 12 volt goes about 2x as long. I use the quick charger now, but I used to use the wall charger about 12-15 hours, maybe more for the 12 volt, and it always seemd to work OK.

My woe is that the 12 volt battery doesn't seem to hold its charge as well after being cycled only 20x or so (they should go a few hundred without noticible decay). When my radio warns me of low battery on the 7.5v, I can still transmit on low power for as long as 5min, and listen for a couple of hours maybe. With the larger battery, "low power" means *change battery now*, the very next key-up could kill it. Sometimes I don't even get the low indication, the radio just dies!

I'm not impressed with the quality of Alinco batteries. Radio is great though!

It's not a bug, it's a *feature*. Remember, the 720/720A has only
two memories. The "band start" frequencies come out of a ROM.

I have a slightly older plain old 720 and it works the same way. That's
the way things work with 15 year old radios -- they don't have all the
niceties the new rigs do.

Coincidentially, I picked up a Heath "Laboratory" scope of the same vintage last weekend. My expectations (and needs) were low, but I was still surprised at the crude circuit and the flimsy mechanical construction. I was especially amused by how the focusing voltage (~1000 volts) was run through a cheapo pot for the focusing adjustment (nasty shock hazard!).

On the other hand, in 1975 or so, I built a GR-78 shortwave radio. This had a pretty good circuit, and really solid mechanicals. I would still use it today if I didn't own a R5000, TS-50, or a Sangean....

What nobody has mentioned is that this "Laboratory" scope (IO-18) sold _new_ for $109. It was listed in the catalog as a 5mHz recurrent-sweep 'scope, and was just the ticket when I bought one with money from mowing lawns and such. There was a lot of stuff in the Hewlett-Packard catalog I'd rather have had, but I could afford the Heath 'scope. The only thing bad about it, given the price, was the "Laboratory" moniker, when even an 11-year-old could see that no lab would touch it.

Still, that's not an excuse for the letter about the transformer. That's atypical, though, as other posts have suggested. I've had excellent service from them, and I still use the first kit I built, 26 years ago: an AM portable radio.

Jim,
I can't point you at the mod, but I *can* tell you that a 1750Hz toneburst
on 70Cms is fast becoming a waste of time:-

a) They are generally needed exactly once per contact - once the
machine has been activated, they're (generally) redundant.

b) You can get by with a whistle :-)

c) Many machines also now (concurrently) support CTCSS [PL(tm) for you]

Anyone have any info on companies that may make some sort of solar
charger for 2m handheld batteries?

Thanks,
Chris Magnuson
chrism@col.hp.com

78. Re: Heathkit Fairy-Tale

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-10 21:29:40 UTC
From: fyl@ssc.com
Message-ID: <1994Jan10.212940.17919@ssc.com>
Source record: 228455

I guess I should add to the Heath "experience". My first Heathkit
was a V7A VTVM, circa 1960. I donated it to a school in Nicaragua
a few years back, then bought another one at a swap meet to use
with a home-built RF probe.

I also still have my Heath AR-15 stereo I built in 1968. It is "retired"
because I wanted digital tuning and remote control but it still works.
In daily use from 1968 to 1990 the major problems were 1 dial cord,
about 4 sets of pilot lamps for the display and one bad coupling
capacitor.

Even though some people felt they leared little from Heathkits, I have
learned a lot. I have built about 20 kits including a twoer, DX-20,
three scopes, signal generator, LRC bridge, FET-VOM, some sort of fancy
low-band xcvr (don't remember the model but I still have it), h19 terminal
(which I also still have) and other assorted kits. All of them were
reasonably trouble free and calling Heath 10 or more years later looking
for a part (like a replacement face for the V7A meter) resulted in
a part in the mail within a few days. The twoer even inspired me to
design and build a "better twoer".

79. Kenwood TM-631/731 X-Band Repeat Enable?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-11 09:51:22 UTC
From: holdwick_marc@macmail1.rtsg.mot.com
Message-ID: <holdwick_marc-110194155122@mac-am-47.cig.mot.com>
Source record: 228461

I recently purchased a Kenwood TM-631 (2m/220 clone of the 2m/70cm 731).
It mentions in the brochure cross band repeat capability after
modification.

Could someone please tell me what modification needs to be done?

Thanks,

Marc Holdwick - N8KWX

80. Opinions on dual-band mobiles: Yaesu vs. Alinco

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-11 15:24:39 UTC
From: plymale@myhost.subdomain.domain
Message-ID: <2gugbn$guh@vtserf.cc.vt.edu>
Source record: 228456

I am currently investigating the purchase of a dual-band mobile
and have narrowed the selection down to either an Alinco DR-600T
or the Yaesu FT-5100/5200 models. Does anyone have strong opinions
or facts which support the selection of one over the other?

Thanks ...

Bill Plymale - KD4CIY

81. Autek QF-1A Manual

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-11 20:58:22 UTC
From: ham@wam.umd.edu
Message-ID: <2gv3te$cc5@cville-srv.wam.umd.edu>
Source record: 228457

I have an Autek QF-1A Audio filter. Great filter. But I have no manual,
and it would be nice to have a copy. It's got the 120V xformer in it,
and there's supposedly a section of the manual that describes the
connection of a 12V adapter (where to hook it to the PC board).

Anyone who can help?

Thanks,

Here is what I have...

FT530

Date: 31 Dec 92 23:11:14 EST (Thu)
From: wa2ise@kb1bd.#cnj.nj.usa.na (BOB)
Subject: FT530 ext TX/RX mod file

YAESU FT-530

Expanded Receive 110-180, 300-500 MHz
Expanded Transmit 130-180, 400-470 MHz

NOT LEGAL IN U.S.A - FOR EXPORT ONLY

o Remove Antenna and Battery.
o Remove four screws on bottom holding battery track.
o Remove the four (black) screws holding rear case.
o Slowly... open the front cover from tranceiver and lay both halves on table.
o Note positioning of white paper insulator in right half of radio and lift out
(don't throw away)
o Carefully locate Jumper Pad 13 and remove solder.
o Re-install white paper insulator, make sure ground tab slides through the
paper insulator.
o Close radio back up (Careful not to pinch the ribbon cable near lithium
battery when closing halves).
o Re-install the four (black) screws holding rear case.
o Re-install the four (small silver) screws on bottom holding battery track to
radio body.
o Attach Antenna and Battery.
o Turn off Radio.... Press and hold both arrow keys while turning on the Radio.
o Modification Complete.

==========
Note: I haven't tried or verified this, proceed at your own risk.
And do not transmit outside of band! WA2ISE
FT530.1

HI, THIS MESSAGE IS FOR THOSE WHO HAVE DONE THE PAD 13 MOD TO THE FT-530.
THIS SEQUENCE PERMITS PUTTING A 500 MHZ OR HIGHER FREQ IN A MEMORY CHANNEL.
EXAMPLE: TO ENTER A FREQ OF 506.8375 MAKE SURE YOU ARE IN THE UHF BAND.

1. PRESS 'FM'
2. PRESS 'STEP'
3. ROTATE DIAL TO SELECT 12.5 STEP
4. PRESS 'STEP'
5. ENTER 800.00
6. PRESS 'FM'
7. PRESS '\/' MHZ

799.00 WILL SHOW ON THE DISPLAY. TURN THE DIAL (TOP RIGHT-RUBBER DUCK ON LEFT)
COUNTER CLOCKWISE. THE DISPLAY WILL DECREASE IN 1 MHZ STEPS. IF YOU PAUSE
FOR MORE THAN 2 SECONDS IT WILL REVERT TO A DECREASE OF KHZ STEPS. TO GET
BACK TO MHZ STEPS JUST PRESS 'FM' THEN PRESS '\/' MHZ. CONTINUE TILL 507.00
SHOWS ON THE DISPLAY. PAUSE FOR 3SEC. TURN DIAL COUNTER CLOCKWISE AND THE
FREQ WILL DECREASE IN KHZ STEPS. TURN TILL 506.8375 SHOWS ON THE DISPLAY.

8. PRESS 'FM' FOR 3 SEC.THE MEMORY CHANNEL NUMBER WILL BE FLASHING.
9. TURN DIAL TO SELECT MEMORY CHANNEL
10.WHEN CHANNEL IS SELECTED PRESS 'FM'. THE FREQ IS ENTERED IN THAT MEMORY CH.

IF YOU GO PASS THE FREQ YOU CANNOT TURN THE DIAL CLOCKWISE TO GO UP FREQ. IF
YOU DO SO THE DISPLAY REVERTS TO 300 MHZ AND YOU MUST START AT #5. HELPFUL HINT
EXAMPLE: 506.8375 IS NOW IN MEMORY CHANNEL 5. PRESS 'MR' AND SELECT
CHANNEL 5. 506.8375 IS NOW ON THE DISPLAY. PRESSING 'MR' AGAIN WILL
NORMALLY LET YOU (>>>> SHOWS UNDER CHANNEL NUMBER) TUNE UP OR DOWN IN FREQ.
NOW ON THESE OVER 500 MHZ FREQ YOU CAN ONLY TUNE DOWN (COUNTER CLOCKWISE).
TUNE UP (CLOCKWISE) AND DISPLAY GO TO 300.XX MHZ . PRESS 'MR' AND THE

CORRECT MEMORY CHANNEL FREQ IS DISPLAYED AGAIN . THE PLL ON MY UNIT WILL NOT LOCK ABOVE 507.6 MHZ ON ANOTHER FT-530 IT WILL LOCK OVER 508.4. PRESSING THE PUSH TO TALK WILL DISPLAY AN ERROR ON THE DISPLAY AND IF THE PLL WILL NOT HOLD THE FREQ DISPLAY WILL FLASH. 800-950 IS THE UPPER RANGE OF MY UNIT AND RECEIVES FB. ANY OTHER MODS OR KEY INPUTS PLEASE SEND TO WA3YZL @WB3JOE. PA.USA 73 PAUL04-Jan-93 21:29
FT530.2

I have a comment on the FT530 mod. Near the end of the instructions there is a warning not to transmit out of band; maybe a comment should be added to remind users that the FT530 can store a separate transmit frequency (not just an offset). I did this for the items I stored in memory, that were in the extended transmit range. This way if I ever make a mistake, I transmit on a HAM frequency, not the public service freq I was listening to..

84. Portable 2m Antenna for Mountaineering???

Newsgroup: rec.radio.amateur.equipment

From: mercer@dgs.dnd.ca
Message-ID: <2gv7jp$3e0@netfs.dnd.ca>
Source record: 228459
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

I am an avid climber/backpacker etc and want to be able to use my HT in the backcountry. I require a design for an antenna (with better gain than my rubber duck) that is light, easily packable, and not too bulky, which will allow me to work repeaters in the 2m band. In case it matters, most (but not all) of the use will be from mountain tops.

Obviously, a 1/2 wave diapole is a candidate but I was wondering if there are any others?

How about a boom that can be disassembeled? A flexable J pole? I would appreciate any and all suggestions.

Thanks
DAve

I've just received a small portable shortwave radio as a gift. I've never used a shortwave before,but I started to read up on it a bit and now I would like to get more into listening but I need to improve the Antennae situation. It's a Grundig
"Traveller II" 7-band. There's no jack for any external antennae but I thought someone might tell me what I could do to improve the reception. This portable size is great for travelling but at home until I fall in love with the whole thing and get
something more involved I'd like to see what I can do with this model. Thanx in advance.

Obviously a roled up twinlead J-pole will offer better performance than
the rubber dummy load, and it's easy to carry in the pack. However, if
you're really in the back country, a collapsable beam will be much better.
Simple designs based on folding elements from common TV antennas are
available. You can slip the folded antenna into a PVC tube and use that
as a walking stick. When you're ready to operate, the PVC can double as
a short mast.

I'd recommend an AEA Hot Rod (tm) antenna or similar.
Its a half-wave vertical (so no ground radials required) that
fits onto an HT BNC, telescopes down to about 8 inches long.
(There's one laying somewhere on the Continental Divide Trail,
where I dropped it.:-)

2nd choice is a j-pole made out of TV twinlead. Not really that
great unless there are usually trees around to hang it in.
Even then its probably too much hassle for the hiking/backpacking
scenario.

There are beams that disassemble, but unless you really need the
few dB of gain and are going to stay put for a while, I'd say
they are too much hassle as well.

I've been using a J-pole for years now.. it's made of 1/4 inch Al, and
breaks down into 3 x 1/4 wavelength sections. When I go tramping (hiking)
into areas where rptr coverage is marginal, I just strap the thing to the
side of my pack (slip it inside my compression straps). Takes less than
a minute to take it off the side of the pack and assemble it, and it
weighs next to nothing. The antenna has survived fairly rough treatment,
and is still going strong. I've decided that the extra hassles involved
in carrying a beam (ie extra weight and bulk) are not justified; the
J-pole is also easily repairable should any damage occur.
What I am now looking for is a rugged dual band antenna design (no radials)
that I can break down and throw onto the pack. Any suggestions??? Some of the
hills around here reflect UHF signals into the valleys much better thhan 2m
ones, though generally, attenuation in the bush on 70cm seems to be a lot
greater than at 2m.

cheers,
Dave, ZL2BHE.

David,

Try a rolled up J-pole. It's made of 300 Ohm Twin lead and tapped with a
50 Ohm coax with BNC connector on opposite end. It provides about 2.8dB
gain. You can buy the ant from MFJ for about $12 or build it yourself.
The dimensions are below:

```
-- for 146MHz center freq
|
|
|
|
this side |
56" |
| | <---------------------------------- trim here for best SWR.
| | 14" on this side
| |
coax====> - - 1-3/4" tap from bottom
| |
---
```

I've experimented with lots of these with good results (built about 30 or so
for myself, friends, and local HAM classes).

Good luck and 73,
Tom

Hi there ,

I got possession of this instrument but not manual (user nor owner)

WAYNE KERR
Automatic Component Bridge
B605

I think this is used to measure C and L and R but not completly sure.
It has 4 boards (logic,analogic,supply and display) built more or less
in 1984 I guess. It has a pod where to place the component under measurement
connected to the mainframe with 2 coax cable plus another cable with a jack
with two contact at the mainframe end.

The other problem is that the LCD of it ,I think, is not working
so I am looking for the schematics of this object other than
the user's manual.
I will pay xerox and shipment if somebody can help me suppling
them to me.
Last question: is Wayne Kerr still in the
buisness so that I could ask to them for some help.

Thanks to anybody that will reply to me I prefer email directly
to me at robertov@hqlab.ico.olivetti.com

Since a J-pole is an end-fed 1/2 wave vertical, how does it have
2.8 dB of gain? 2.8dB of gain in relation to what? A quarter-wave?
A dipole? An isotropic radiator?

Optimally, a J-pole will have 0 dB relative to a 1/2 wave dipole,
but the matching section contributes loss, so I'd normally expect
a J-pole to provide a little less than 0dB, say -.5dB relative
to a dipole. If so, this is something like 1.5dB over an isotropic
radiator...

This is a partial listing taken from a complete list that is posted in Compuserve HAMNET Library 10 in the file RADIOS.TXT....or available via 2-stamp SASE to the above address.

E. H. Scott SLR-M "Marine Radio" covering 550khz - 18 mhz in 4 bands. Used briefly by the Navy toward the end of the war as a replacement for the superb RBO for AM & CW. Then sold commercially into the merchant marine market for several years after the war. This one looks and works almost mint. It does a great job on all modes, including SSB, and looks brand new inside. Designed for rack-mounting, this one has the scarce desk cabinet and shockmount, but one of the cabinet brackets is missing. A fine collector's item in collector-quality condition. $475
Globe (World Radio Labs) LA-1 Linear amplifier. 1957-vintage linear using 4 EL-38 tubes in a grounded-grid design. Built for 80 - 6 meter operation, this one has had six meters removed and replaced with 160 meters (nothing shows and this would be easily backed-out). Works perfectly. Gets 150 to 210 watts out in AM/CW and SSB from 10-18 watts of drive. With original manual. A real collector's find. $265
Military T-282DGR UHF 200 watt transmitter. Designed for 230-400mhz, the original owner notes in the documentation that it easily tunes 189-418 mhz. Uses 2 4X150 tubes in a tuned cavity. Blower-cooled. Rackmount. Requires external power supply (not included). All functions metered. With schematic, partial manual copy and diagrams of the power supply and interconnecting cable pinouts. AM or FM. 1954-vintage. $99
Kenwood R599 (silver) receiver. The original Kenwood design that led to the introduction of their TS-series of transcievers. Covers all the original HF bands 160 - 10 meters. No WARC bands. Includes FM capability which is quite useful for the 6 meter and 2 meter internal converters that are installed in it. Has separate antenna connections for HF, 6 and 2. Runs on 110vac and 12vdc. With original manual. Has a few scratches on case, but front panel is near-mint. Works perfectly. This is an excellent receiver. $299 with both converters installed. $149 with converters removed.
Kenwood 6 meter internal converter for the R599. Currently installed in the receiver above, I will remove it and sell it separately for $139. Excellent original condition.
Kenwood 2 meter internal converter for the R599. Currently installed in the receiver above, I will remove it and sell it separately for $139. Excellent original condition.
Kenwood T599D (gold) HF transmitter. 80 - 10 meters. No WARC bands. All

solid-state, analog design with 12BY7A tube driver pushing a pair of 6146B finals. Case has a few scratches, but front panel is near-mint. Works fine, but I have not checked it for full power output. One small problem on phone: The mic-impedance switch is noisy and needs cleaned or replaced (it acts intermittent). Includes cable to connect to R599-series receiver in which configuration it can be used with the receiver as a dual-VFO transciever. With original manual. $179 as described above. Kenwood PTT hand mic: Add $19.

Johnson 23 channel CB. 12v mobile/110vac base. Model 123A. w/mic. Good. $19

Johnson 40 channel CB. 12v mobile only. Model 4125. Very good. w/mic. $39

Harvey Wells T/90-R9A station. 1955-vintage transmitter/receiver pair with external power supply. All three units are painted in the HW matching two-tone grey scheme. The set covers 10 - 80 meters with the internal VFO. Everything is in very good or better working condition and all original. The receiver tuning slips a bit but that should be easily fixed. The receiver tunes sideband with the BFO but the rig was designed for AM/CW use, base or mobile (though I do not have the mobile supply). With original TX and PS manuals (but no RX manual). This is a scarce set made in the last days of Harvey Wells. $279

National NC-188. Uncommon National design from the 60s. This radio has a long horizontal dial splt into tuning on the left and ham bandspread on the right (like the Hallicrafters SX-71). Works, but case is just fair. Has one small surface rust spot on the front panel. $75

Eico HFT-90 FM tuner. Designed for custom mounting (no cabinet). Very nice. Works perfectly. Multiplex and mono outputs. $30

Eico HF-20 integrated mono amplifier. Dual 6L6 design. Looks and works excellent. $49

Grommes 55C integrated mono amplifier. Dual-6L6 design. Looks great. Needs electrolytics replaced. $29

Gates 7X "Remote Control Amplifier," rackmount, mono w/mic input. Top-of-the-line, excellent: $49

E. F. Johnson Invader 200. 1963-vintage AM/CW/SSB 200 watt transmitter. While the Valiant II gets all the attention, the Invader goes quietly about its business of being the best piece of Johnson gear ever made. You can look it up: The original Invader list price was double the price of the Valiant. And Johnson offered a 2000 watt (external) upgrade kit for the Invader (not for the Valiant) that had none of the TVI problems of the Desk Kilowatt. This Invader is in good working condition. The front panel is excellent but the case has a bunch of small paint chips. Manual copy. $219

E. F. Johnson Invader 200. Same as above, but excellent+ condition, with original manual and spare power transformer. $319

Hallicrafters HT-37 transmitter, 1963, in positively wonderful condition, paint sparkles, front panel is showroom-grade, with original manual and dow-key relay: $115

Hallicrafters S-36 1942-vintage VHF receiver. Early in the war, the War Department comandeered the production line output of the ham radio manuafacturers, including Hallicrafters. This 27.8-143mhz AM/FM, set was one of the first civilian-design sets in use and was instrumental in decoding the German "knickbein" radio beam used to target bombers over Great Britain. The plate says "Ultra High Frequency Communications

Receiver." This is a true S-36 (not the "A" which came later) which Hallicrafters whipped off the production line so fast they didn't have time to replace the S-27 dial-cover. No mods, clean and gorgeous. I am only aware of one of these offered for sale in the past 2 years. RARE+. Prefer trade or $229

Hallicrafters S-36A, 1944-vintage. This is basically the same radio as above but from later in the war. A fine-working VHF beauty. Trade or $199

Hallicrafters R-44/ARR-5 WWII Military airborne (B-29) VHF radio. Scarce example of the military S-36A with motorized tuning. 27-140mhz. Requires external power supply (not included). NO MODS (this is important--almost all of these you see have the electric band change switch removed and the power connector modified or removed. Even the radio in the Smithsonian's Enola Gay exhibit has a modified power connector.) Excellent working condition. Prefer trade or $239

R-388 General Coverage Receiver made by Collins. Covers 0.5-30.5 mhz in 1mhz bands. This radio works, but is being offered AS-IS. Here's what's wrong: This is a rackmount radio (there is no desktop cabinet). It is missing the top dust cover. The mhz dial indicator is also missing. The band change knob does not rotate the drum with the mhz numbers on it (so you can't tell where you are at all). Here's what's right with it: It is unmodified and original. The knobs are all original and the front panel is in nice shape (although there are some chips around the edges, typical of rackmount gear). It really works well, with all the sensitivity and stability of Collins gear from this era. Sams Photofact included. AS-DESCRIBED ABOVE: $175. Original manual available for $25 additional.

RCA ACR-136 receiver, 1938-vintage GC receiver with airplane dial. This very rare radio needs restoration. It is electrically excellent (but untested). Two knobs are not original. The dial face is badly yellowed. The cabinet has been repainted and needs stripped and redone. No mods. No rust or corrosion. Makes a great collectable radio. $140

National RCP "Airway Communication Receiver." Hah! Just when you think you know National pretty well, along comes this oddity. This is a 1945-vintage National RCL modified by Schuttig and Company for the Civil Aeronautics Administration. This set combines the sliding-coil rack of NC-100A fame with the HRO-style PW dial to cover 200-400khz and 1.3 to 30 mhz. The CAA mods to the radio include selectable crystal or VFO control, AVC that tracks the average carrier input, a squelch feature, improved stability and filtering and a switch-selectable noise limiter. Rackmount (no cabinet). Looks good, but does not work. Unique National collectable. Manual photocopy. $149

Hammarlund SP-400. Complete, less power supply. Needs work. The band change knob is stiff. The phasing control shaft is broken off and missing. One tuning knob is cracked. But is is all original with no mods. The case and front panel are in very good or better condition. AS-IS: $95

Zenith T600 Transoceanic. Excellent+ cosmetic condition. Dial cord broken. Does not work (it worked two months ago but doesn't now--go figure). This is the nicest looking Transoceanic I have ever seen. With original manual, papers and Zenith SWL guide (in lid). Oh yes...it is dirty on top from sitting in my (dry) basement. Of course, so is everything else on this list. $105.

98. Memory Module for ICOM-R71A Receiver

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-12 20:44:02 UTC
From: ehud@dsys.ncsl.nist.gov
Message-ID: <CJJAxE.9AC@nist.gov>
Source record: 228475

I own an old ICOM R71A HF Receiver, which I purchased back in 1987.
At that time there was a big argument about the memory module's
dependence on the Lithium battery, so that when the battery dies,
the program is erased and the whole receiver is rendered useless.
I wander whether it is possible to get an EPROM/ROM version of the
memory module from ICOM (or any other source), which is not dependent
on the Lithium battery. Fortunately, my receiver is still operative
after 7 years, but I suspect it may die soon.

Any information will greatly be appreciated.

I own two FT-5100s, one at home and one in the car. Iam REASONABLY happy
with them. What I don't like is the fact that the FT-5100's countless
features also make it a relatively cumbersome radio to program. Moreover,
the manual is not always as clear as it might be. On the plus side:
outstanding and very reliable performance. Oh, yes: you've got to be
careful not to accidentally hit one or more of the many pushbuttons on the
front when fumbling around in a dark car--you may end up in some mode or
other which you will DEFINITELY not be able to get out of while driving...

Brent-
I know of no Keyboard mods for the 530. I own the 530 and have performed the extended recieve mod and it works great. Doing the mod really makes the radio worthwhile. I got the offical mod sheet from yaesu and the only other mod is one which enables the tone-burst (1750 Hz) function so the unit can be used abroad. All you do is put a solder jumper across pad 15.

106. SSB Electronics

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-13 02:15:44 UTC
From: wa2sff@cbnewsh.cb.att.com
Message-ID: <CJJqAA.9x8@cbnewsh.cb.att.com>
Source record: 228479

Has anyone had any experiences with SSB Electronics?
They advertize in QST and other places for VHF and UHF
equipment. I sent in some stamps for a catalog in
early December and have yet to receive it.
I called them one night (they are only open at night) and
spoke to the person there. He told me their catalog is
out of print but he would be sending out some flyers and
would return my stamps. Well, I still have no flyer,
catalog or stamps.
I am not really concerned about the stamps. But if it
takes 6 weeks plus to get information, how long do
they take to fill orders and is the equipment any good?

Joe Wilkes

107. ICOM R100 experience/substitutes sought

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-13 05:59:53 UTC
From: barber@cobbets.mv.com
Message-ID: <758440793.2snx@cobbets.mv.com>
Source record: 228482

I would like to buy a wide range, general purpose receiver mainly to introduce my older kids to all the things on the airwaves, including shortwave and more traditional 'scanner' stuff. Coverage below 6 MHz would be a big plus for satellite SCPC reception. Coverage up to about 1 GHz would be adequate, although I could care less about cell phone reception. AM, FM and SSB are all musts; channel memories, scanning, searching etc would be big pluses. The only receiver I have found that seems to fit the bill for under $1000 is the ICOM R100. Will it give me the above features and good RF performance, particularly selectivity ? Are there other units I should consider ? Owner's impressions would be particularly valuable.
Thanks for any help.

108. HT Recs?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-13 07:03:33 UTC
From: hoagy@illuminati.io.com
Message-ID: <2h2ro5$kli@illuminati.io.com>
Source record: 228483

I take my Tech No-Code test Saturday. Yes, I'll pass. Of course.
I'm ready! Within a month, I'll be sending away for an HT.

I don't really care for the "Realistic" $300 dollar Radio
Shack model. I've had some bad luck with other Realistic products
in the past, and this model is *not* attractive at all.

I would like honest opinions on a DUAL-BAND HT for $350 or less.
CTCSS, paging, DT, scanning/programmed stations, lighted display,
etc etc etc. The model should have at least 3 watts power(though some
have 2, 5 with an 'optional' 12V supply).

I'm leaning towards Icom. Yaesu also appears impresive.
And, of course, Alinco models are nice as well. All companies from
what I understand are very reputable. I just need recommendations.
Since I don't have the $$ for a home-rig, an HT *must* be my only
source for amateur contact until I can afford a rig. So, if you keep
that in mind. A product from Midland, the 73-005 Transceiver in the
December 1993 edition of "73 Amatuer Radio Today" gives this unit
a good rating. It's what I'd like, save it's only 2m. (And $239 to
boot!)

Suggestions? Reviews?

They use a lot of designs from the German HAM UHF community. I built several serveral transverters and they all perform quit well. (2M, 70cm, 23cm, 13cm)

```
YAESU FT-530

Expanded Receive 110-180, 300-500 MHz
Expanded Transmit 130-180, 400-470 MHz

NOT LEGAL IN U.S.A - FOR EXPORT ONLY

o Remove Antenna and Battery.
o Remove four screws on bottom holding battery track.
o Remove the four (black) screws holding rear case.
o Slowly... open the front cover from tranceiver and lay both halves on table.
o Note positioning of white paper insulator in right half of radio and lift out
(don't throw away)
o Carefully locate Jumper Pad 13 and remove solder.
o Re-install white paper insulator, make sure ground tab slides through the
paper insulator.
o Close radio back up (Careful not to pinch the ribbon cable near lithium
battery when closing halves).
o Re-install the four (black) screws holding rear case.
o Re-install the four (small silver) screws on bottom holding battery track to
radio body.
o Attach Antenna and Battery.
o Turn off Radio.... Press and hold both arrow keys while turning on the Radio.
o Modification Complete.

Just 6 Meters (according to rumor).
Doesn't surprise me that they didn't smush HF + 6M in that box,
but makes me wonder what they might have done (like adding 2M).

I have hiked several times with my Cushcraft 4 element 2 meter beam. If you need the extra gain from a beam, it works great and is not overly bulky to carry if you pack it into a tube or keep it in the original box. I use wingnuts to speed the assembly process and have a portable tripod to mount the thing. It's sort of home-brewed out of a similar design I saw in the ARRL handbook. Anyway, like someone else said here, the AEA Hotrod is a great little telescopic antenna that outperforms a duck several times over.

Well I'm not so avid, but I'd like to be. Make the roll-up J-pole.
Around here, the mountain tops are where the repeaters ARE, so I
look for a better signal from the bottom of the Gorge.

Hey maybe you could load up a variety of wired nuts and see if any
might present a match???

Have been reading the Ad for the TENTEC Scout.

They mentioned they only sell direct and there is a 4 1/2 week
backlog.

Does anyone have any experience with the Radio as to how it performs?

Thanks in advance

Hello everyone,

I am considering becoming active on 6m and I am looking
for advices on what equipment to buy (new or second hand).
I would appreciate any opinion/ personnal experience/ proposition on
- handeld rig
- desktop rig
- antenna (vertical and beam)
- linear amplifier
- ...

Thanks in advance.

Please post or e-mail (I'll forward every general info the maintainer of
the 6m FAQ).

It *is* a very good two meter radio. The Shack has to get lucky once
in a while. And when they put it on sale it's a great deal.

> I would like honest opinions on a DUAL-BAND HT for $350 or less.
>CTCSS, paging, DT, scanning/programmed stations, lighted display,

Ah, you're not asking for much are you? :-)
Only the Alinco DJ580 comes close to your price ceiling in new equipment.
To stay under $350, you're going to have to haunt the used equipment
lists. That's OK, a used FT470 is still a good radio, and you can certainly
find one for your target price.

I purchased my (apparently) ill-fated TH-77A from a
local dealer about 2.5 years ago when I first got
into ham radio. When I purchased the rig, the
salesman mentioned that this particular rig
had already had some "standard" mods done to
it, and proceeded to show me some of the key
sequences to activate them. Unfortunaltely,
the store was busy & he couldn't show me very
many, & told me to come back later. Well, I
never went back, and he doesn't work there
anymore anyway. So, does anyone have a
list of "standard" mods & how to invoke
them for this short-lived HT?

My good friend W8PBO won one of these at the W.V. hamfest (he is the luckiest ham around, you would not believe the stuff he's WON in the last few years).

Anyway, he is a die-hard TenTec fan and loves the rig. Only complaint is that the CPU generates the CW for the built in keyer and at his speeds (50+ wpm) the CPU goes bonkers.

I have a brand new TS-690. The receiver is full coverage from 300KHz
through 60MHz with no skipped frequency segments.

Is the TS-690 sold in the UK different?

If you hear of any mods for the TS-690, I'd sure like to know of them
also.

I bought a Yeseu 2200h about 5 or 6 months again when I got my licence. Yeseu advertised that the radio had an extended receive on 110-140Mhz, for aircraft. It can recieve Am in this band. It is published in the manual that you can initiate the extended recieve but it is not guarenteed to work.

Well it doesn't.

Has anyone had this problem or know how to solve it? Is there a simple modification allow for the band.

Thanks in advance
Chris

I have a UK spec TS690 which receives up to 30MHz, then jumps to 50MHz and goes on upto 54MHz. I have ask about this before, and the American model does appear to be different in that sense. I can _force_ it to receive between 30 and 50 - I know because I have done it twice now to listen to our baby monitor on 49MHz. Trouble is, I just cant remember how!

As for mods, the only one I have seen was to enable general coverage for transmit. I DO NOT WANT that so I discarded it.

> or the Yaesu FT-5100/5200 models. Does anyone have strong opinions
> or facts which support the selection of one over the other?

I used to have an Alinco 590 which is a relatively close relative of
the 600. I now own two 5100's. The reason is simple -- the user
interface of the 590 was PERVERSE. I've played with a 600 and it has
most of the same problems. I strongly suggest you go play with both
radios before you buy either -- you'll learn a lot.

Some differences:
5100 has one antenna pigtail, 600 has two -- which is best depends
on whether you have a dual band antenna
5100 is much smaller than 600
600 has full remote control, 5100 doesn't
600 has HUGE heat sink, 5100 gets hot during TX
5100 scans a lot faster than 590 (don't know speed of 600)
5100 does dual 2m/70cm RX, 5200 doesn't, 600 ???
DTMF pager func is different (big deal)

Archive-name: radio/personal-intro
Revision: 1.5 12/18/93 14:15:53
Changes: new mailing lists, .packet rmgroup, and .policy updates

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info,
and rec.radio.swap newsgroups. It is intended to serve as a guide for the new
reader on what to find where. Questions and comments may be directed to the
author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 18 September
1993 to add the mailing lists for the new rec.radio.amateur newsgroups, to
note the rmgroup of rec.radio.amateur.packet, and to officially retire some
(in)famous threads of discussion on rec.radio.amateur.policy.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began
to dominate other topics in the group and on the list. This resulted in the
logical solution: a group was created to hold the packet discussion, and
another corresponding mailing list was created as well: net.ham-radio.packet
and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great
Renaming essentially unchanged, moving from net.ham-radio[.packet] to
rec.ham-radio[.packet]. Readership and volume grew with the rest of the
network.

The INFO-HAMS mailing list was originally run from a US Army computer at
White Sands Missile Range, SIMTEL20. There were few problems with this
arrangement, but one was that the system was not supposed to be used for
commercial purposes. Since one of hams' favorite pastimes is swapping
gear, it was natural for hams to post messages about equipment for sale
to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use
restriction, and after some argument, a group was created specifically
```

for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize

this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, should be removed by September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas,

commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

136. MFJ-1214 multimode. Help!

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-15 13:15:12 UTC
From: asirene@ntuvax.ntu.ac.sg
Message-ID: <1994Jan15.211512.1@ntuvax.ntu.ac.sg>
Source record: 228364

Hi,
I need help and info for the MFJ-12134 multi-mode interface. Does
anyone out there have any information on this interface? Things like
circuit diagram, progaramming details or even programs for controling it?
Help! Tks.

137. wanted: IC-730 digital tricks

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-15 14:29:33 UTC
From: tmedin@che2.che.umn.edu
Message-ID: <18971.tmedin@che2.che.umn.edu>
Source record: 228365

I would like to know if anyone knows of any mods or tricks to make an IC-730 work on Amtor or Pactor. Another radio can innitiate a connection with it, and it can maintain the connection, poorly, for 5-10 minutes; however, it cannot innitiate a connection. This leads me to believe that its switching rate is just outside of the acceptable range.
Thankyou.

tom medin, N0UFM

138. Yaesu FNB-27 12V Battery acting up?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-15 17:53:37 UTC
From: lmcifpl@LMC.Ericsson.SE
Message-ID: <1994Jan15.175337.22810@exu.ericsson.se>
Source record: 228366

I'm just after purchasing a 12V recharageable battery (FNB-27) for my Yaesu FT-530
HT (nice radio!) and charged it for the recommmended time when I got it last week.
I've been using it on and off since Thursday (interchanging with my
7.2V FNB-25 battery). This morning the radio was reading a battery level of 11V
when I started to monitor several repeaters in the Montreal area.
Within 30 minutes of the battery level hitting 10V it had dived to
5.2V. Giving it a rest for 5 minutes, the level is back to 7V.
The second I get it to scan the frequencies in memory, it does a
(very quick) countdown to 5.2V. (10 secs to get from 7V to 5.2V !)
If I don't scan, but stay on one frequency,
the dive is less dramatic (10 secs for 1V decrease or faster!).

The outside temperature today is -27C, but when outside
the HT has been inside my jacket (so is operating within the temp specs).

Do I have a bum battery? Or is there some other explanation ?

>never went back, and he doesn't work there
>anymore anyway. So, does anyone have a
>list of "standard" mods & how to invoke
>them for this short-lived HT?
>
>
>
First, I have been using my TH-77A for years and it has worked like
a champ. Don't be to harsh on it. If you do not have a manual,
contact Kenwood in LA. They will ship you one.

Second, the "standard" mods. The first is cross-band repeat. To
enable cross band mode, first set the frequencies and decoding,
etc. into the two band displays. Turn off the radio. Turn it
back on while holding down the SUB UP key. To disable, turn off
the radio. Then turn it back on while holding down the SUB UP key.

The next is the aircraft band receive. You can find this band by
selecting the 2 meter band as your main display. Press UxU until
you see a 118 to 136 mhz display. This is the aircraft band. In
other words, UxU on 2 meters switches between 144, 440, and 118
mhz segments. If you display the 440 band as your main display,
UxU will switch you between 440 and 800 mhz! By the way, these
other bands can be stored in memory.

Those are the main mods. Out of band operation does not require
any special keystrokes. If you have any other questions about the
77, feel free to e-mail me. If I don't have the answer, I'll try
to find it.

Pete WB0FEW

140. Yaesu FT101 owners: Group purchase of Fox-Tango Newsletters

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-15 18:48:47 UTC
From: yee@mipg.upenn.edu
Message-ID: <YEE.94Jan15184847@mipgsun.mipg.upenn.edu>
Source record: 228380
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.swap

The old Fox-Tango newsletters is the Yaesu newsletter from the era of
the old FT101 series and contains all sorts of neat hacks for the 101
series transcievers as well as other rigs of the era. It was
published from circa 1972-1985 and is still available from IRC.
Unfortunately, the cost of the newsletters is rather high (circa $80).
I am hoping that there is enough interest to have a group purchase of
these newsletters. I already have a few people interested.

Are there any others interested?

>TH28a 2 meter radio? I am looking for transmit and recieve, as well as
>how to access them on the radio. Thanks
>
>
>your friend
>

If it's a fairly new TH28a then the mod is very simple. Open the radio
as instructed by the manual for installing the memory module. Right
below the micro-processor is a small diode array labeled D8-D11. On the
newer models, there are 2 green jumper wires at each end of this diode
array. simply desolder both of them for extended recieve and tranmit.

Mine recieves the following: 118-136 AM
136-174 FM
340-400 FM
400-520 FM

To switch between the modes hit "F" for 1 second then "LOW". This wiil
switch between 118-136, 340-400, and 136-174. For 400-520 just hit the
"BAND" key, while in the 136-174 mode.

I haven't tested the transmit, but i believe it's for the MARS/CAP freqs.

BTW, no reset or anything is necessary, just do the mod, put it back
together, and turn it on.

I take no responsibility for anything that happens to your radio as a
result of this modification, but It worked just fine on mine and a
friends. And remember DO NOT TRANSMIT OUT OF BAND

For mods on the older version TH28A (w/o green jumpers) check on
ftp.cs.buffalo.edu in /pub/ham-radio/mods.

there you go, have fun.

143. Advice/manual sought for Gonset 6m rig

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-16 04:40:45 UTC
From: kgh@shell.portal.com
Message-ID: <CJpH02.BD3@unix.portal.com>
Source record: 228370

I have a Gonset 111 6 meter transceiver that I picked up secondhand a few years ago. I never got it on the air, even though it did work when I got it. It doesn't work now, however, because I think it blew a filter cap in the power supply.

Anyway, what I want to know is: is it worth fixing it up and putting it into service? Is all the activity on 6m FM now, or sideband, or ??. Would it be hard to convert this rig to FM or Sideband (far as I can tell, it's AM and CW only)? Also, anyone have ideas how to get a VFO for this radio? It's got a jack in the back for one, but have no idea what to plug into it! Presumably, Gonset used to make one, I guess.

I am essentially a neophyte, although I once had a Technician license, I've built several difficult Heathkits in my day, and I am reasonably handy with a soldering iron. So I think I could fix this machine up with some guidance. I know the bit of theory about FM and Sideband that's in the license tests, but have no idea yet of how to put it into practice in a real design. I wouldn't mind learning, however.

Finally, is there anyone that has a manual for this radio who would be willing to copy it for me? Obviously, I'd pay the copying and postage, etc.

Oh, just for the record: I recently passed the Advanced Class test, and am awaiting my ticket. So I'm not planning anything illegal!

144. FT-470 Batteries

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-16 04:48:04 UTC
From: ez006683@othello.ucdavis.edu
Message-ID: <CJpHC5.3p2@ucdavis.edu>
Source record: 228371

Well, My FT-470's standard 7.2V 600mAh (FNB-17) battery pack just gave up the ghost. I took it apart and I am not sure what size the cells are. They look a little larger than an N cell. But I am not really very familiar with N cells and these may simply be N's. They weigh about the same as a AA ni-cad. Anyone have a source for fairly cheap replacements, either presoldered or with tabs? They lasted 2 1/2 years, is this pretty good tor the Yaesu pack?

Thanks,
Dan

Body handling: HTML body converted to readable text

For Sale:
Kenwood TW4000A 25W Dualbander Mobile. Comes with voice read out, tone
card, DTMF mike. Also Connected to it is a 5watt CB with microphone.
For more information Email me here.. Will check often..
It is an older radio but for its age it is in great condition.. only a
minor problem with the voice readout I have used it in
the car and home for packet and it works great! I hooked mine up to a
seperate speaker in the car cause its kind of hard to hear it in a
blazer when on the console.. Comes with its own mounting brackets too..
If anyone needs more info let me know I will be checking here often.
Would like to sell it while im home from college on break.
Sorry guys but no trades, they wont accept ham gear for tuition
payments :) $171 worth of work was done on it BY KENWOOD, I have the
service manual. Its Power is 25 Hi and 5-10 LOW. It is an older radio
with out crossband repeat. The PL board in it is manual there are seperate swithces so you
can have one
tone on 2m and one tone on 440. The case and bracket have shown use
but its a mobile rig. GREAT radio for packet,
field use, company vehicle. Ill pay for UPS
WOULD LIKE:$375 OBO. Oh yeah while im at it: I bought a 2m magnmount and
a 400 magmount antenna from Comtelco in July and I have been using them,
Ill sell them with the radio for an extra $25 for both < I paid 52 for
them new> Very good antennas and very good condition. Finally- A COMPLETE
Tandy 1000EX System 256K (expandable to 728K) Internal 5 1/4 360K DD
External 3 1/2 720K DD CGA Monitor 300 Baud internal modem 9pin Dot Matrix
Printer SOME manuals No software Serial Card
Ill toss in a 2400Bd
external for $25.00 Price- $150.00 Or if someone wants the Computer
system, antennas and radio Ill sell it all for $500.00 (OBO) Please Specify what your
interested in You can contact

Hello,

I was wondering if anyone could help me with a puzzle I have
encountered? In Costa Rica, I saw fluorescent tubes of about 2 feet
being used in conjunction with Yagi antennas for broadcast television.
I suspect it is being used as a bandpass filter but would welcome other
suggestions.

Regards,

Scott

150. How to get 1750 Hz tone to Yaesu FT-530 (A2) ?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-16 18:34:11 UTC
From: riku@nixu.fi
Message-ID: <2hc1b3$lv@smtp.tele.fi>
Source record: 228376

Hi all,

I recently bought Yaesu FT-530 (this is US-export version, A2 I think).

Seems that closing configuration jumper #12 (as mentioned in mod istructions)
is not enough.

Am I missing something (eg. does the 1750 Hz tone need some extra components
or something like that) ?

All information is most welcome, including success (and failure) stories about
1750 Hz mod. If somebody has opened his european version of the FT-530, I
would appreciate information about all config jumpers.

(Wide TX mod worked as instructed)

Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

I am a recently licensed technician class amateur who is looking at buying
a HT. I know someone who is upgrading and is willing to sell me their old
Kenwood 215A HT for a song. Here's the problem. The seller has informed me that
the radio has an out-of-band mod done to it. I would really prefer not to have
this on my first radio for fear of accidentally transmitting out of band. I
called a radio shop about fixing it, but they wanted $60 which is a little out
of my budget if I buy the radio. Is this mod simple to do? I do have some
electronics experience and could probably handle it if it was'nt too complex.
Does anyone have any information that might help me? This posting for a radio
demod probably seems unusual, but I sincerely want to get into amateur radio
playing by the rules. Any help would be greatly appreciated. Thanks.

Below is the mod info on the th215 which I grabbed from world.std.com,
in the directory: pub/hamradio/mods/kenwood, file: th215.mod

Hope it helps.

Date: 2 May 88 15:22:00 GMT
Posted by: silver!commgrp@iuvax.cs.indiana.edu
Subject: Kenwood TH-215A modification

KENWOOD TH-215A handheld transceiver out-of-band modification:

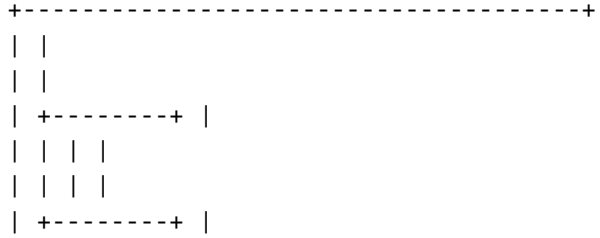
1. Remove two screws from belt clip

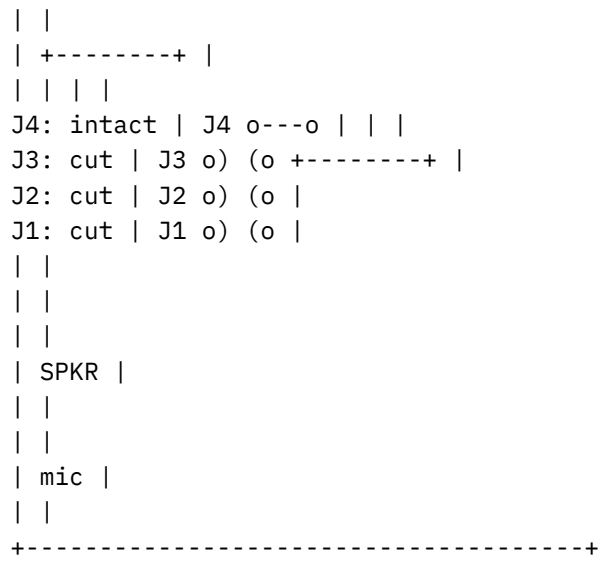
2. Remove 4 screws from back of radio

3. Slide front assembly off

4. Locate set of 4 jumpers:

(top front inside)





5. Reassemble radio.

6. Reset microprocessor: Turn radio on while simultaneously pressing
both _F_ key and _ENTER_ key.

--

DISCLAIMER: I do not own a TH-215A and have not verified the above
information. Hopefully, the modified frequency range includes 162 MHz
weather-broadcast freqs. Remember, it is ILLEGAL to transmit outside
the ham band with non-FCC-type-accepted equipment, even if you are
licensed to use such frequencies.

I am placing this information into the newly-createed mods section on the
World: world.std.com, pub/hamradio/mods/kenwood

The mods area is divided by manufacturer, making browsing MUCH easier.

73,
Scott

A new mods directory has been created on World - world.std.com,
pub/hamradio/mods

It is subdivided by manufacturer, so finding your mod should be a snap.

Most fo these mods are very simple. One solder point or diode but physically they can be very difficult. The boards are small and hard to get to and the people are ripping you off. I woudl buy only a radio that can be reset from the keyboard if you are interested in this and don't want to pay. Yaesu is very mnisleading in ads. They say they can cover aircraft but don't say you have to pay a rip off artist 100 + at a ham show or radio store to get themn to do it. I did mine and I was shaking all of the time. It is TINY.

Hi , Tnx for reading.
I own a DJ160T 2mtrs portable rig. I bougth him in Hong-Kong in
1st hand. Normal RX=130.000Mhz to 174.000Mhz
One day I made something without knowing and he started
receiving from 800.0Mhz to 900.0Mhz (more or less).But this only
works on the CALL channel (C).
Does anyone have any MODS or info for this rig.
THANKS IN ADVANCE... TNX

: either presoldered or with tabs? They lasted 2 1/2 years, is this pretty
: good tor the Yaesu pack?

Yaesu battery packs use 2/3 A size ni/cd cells. I have found several local hobby shops that carry R/C supplies that have them for about $2.50 - $3.00 each.

Re: Portable 2m Antenna for Mountaineering???

Two items come to mind: 1) MFJ makes a portable beam in which the elements store in the boom. Haven't tried it but I do have a portable beam that works well. 2) Larsen Antennas makes a roll-up half-wave that you hang from a tree limb. Nice if you have trees nearby.

162. Kantronics KPC3 V5.1 TNC BUGS!

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-17 22:19:30 UTC
From: "kevin.jessup" <kevin.jessup@mixcom.mixcom.com>
Message-ID: <1994Jan17.221930.24715@mixcom.mixcom.com>
Source record: 228298
Cross-posted to: rec.radio.amateur.packet,rec.radio.amateur.equipment

Is anyone aware of bugs in the Kantronics KPC3 TNC software version 5.1?

I've noticed that if you send a message to "ALL" in the PBBS, no one can read it (or list messages) other than the sysop and the message originator.

If you send a message (actually a bulletin) to "ALL" using the "SB" command, the problem goes away. Changing the flags on existing messages addressed to "ALL" so that the message then becomes a bulletin, also fixes the problem.

Apparently, when you send a message to ALL, the "ALL" text is treated as a call-sign and can only be read by a person who has that call-sign! He must get lots of mail! ;-))

I've heard that there are other bugs related to message forwarding.

So is version 5.2 out yet? ;-)

163. STANDARD CCR708A Info/opinions wanted.

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-17 23:30:10 UTC
From: galen@picea.CFNR.ColoState.EDU
Message-ID: <CJsryA.1C1B@yuma.ACNS.ColoState.EDU>
Source record: 228299
Cross-posted to: rec.radio.scanner,rec.radio.amateur.equipment,sci.electronics

Well, I tried the Ace AR2500 and was sadly disappointed. I'm primarily
interested in RF spectrum analysis but not as extensive as FFT's and such.

The Standard CCR708A looks like an interesting receiver/spectral display
that would satisfy my current needs.
Has anyone out there bought one?
How good is the display/resolution/dynamic range/overall quality?
Is it worth the money?

I've called Std. and they're sending me info, but I'd like to hear reality.

Short spec list:
50-905 MHz, am/fm/wfm, 100 ch mem, direct freq entry,
spectral display, sugg. list $750.

Post 'em if ya got 'em,
Galen, KF0YJ

Are you refering to the FT530 unpublished features wise? If so,
I can email you a detailed mod for extended recieve and transmit (If you
wish to do that). That mod has been posted to this listserv a couple of
times just over the last week, so I'd rather not take up space with it.
I have performed the mod, and I think that it's certainly worthwhile.

165. Global Alert For All: Jesus is Coming Soon

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-18 01:37:44 UTC
From: clarence@orion.cc.andrews.edu
Message-ID: <2hfeh8$suo@orion.cc.andrews.edu>
Source record: 228392

The earthquake in Los Angeles, California, the flood in Europe, the seemingly unstoppable war in the former Yugoslavia, the devastating fires in Australia, the flood in the Midwest of the United States of America, the devastating fires near Los Angeles, California, the rapid and appalling increase in violence in cities, towns, villages all over the world, the famines, the diseases, the rapid decline of the family unit, and the destructive earthquake in India (in 1993) are signs that this world's history is coming to a climax. The human race has trampled on God's Constitution, as given in Exodus 20:1-17 (King James Version Bible), and Jesus is coming to set things right. These rapidly accelerating signs are an indication that Jesus is coming soon (Matthew 24).

God's Holy Spirit is gradually withdrawing its protection from the earth and the devastating events you see are demonstrations of Satan's power. All those who are not guarded by God are in danger of forever losing eternal life.

If you want to know what's about to happen, please study the books of Daniel and Revelation which are located in God's Word, the Bible. They are not sealed or closed books. They can and must be understood by all. Every word in the Bible from Genesis to Revelation is true. The Bible and the Bible only must be your guide.

When God's Law (the Constitution for the Universe) is consistently ignored, disregarded, changed, and questioned, He permits certain events to occur to wake us up. I would urge all, wherever you are and regardless of the circumstances, to directly call on Jesus and ask Him to intervene in your life. Jesus who created this planet and every living creature in it and on it, died on the cross, was raised from the dead by God the Father, and is now in Heaven interceding for you. Jesus is the only One who can rescue us from the slavery, misery, and death Satan is causing us.

For reference I'm including God's Constitution as given in the King James Version Bible. Please note that when God says the seventh day, he means Sabbath (the 7th day of the week) not Sunday (1st day of the week).

Commandment #1: Exodus 20:1-3 (KJV) And God
spake all these words, saying, I am
the LORD thy God, which have brought
thee out of the land of Egypt, out
of the house of bondage. Thou shalt have
no other gods before me.

Commandment #2: Exodus 20:4-6 (KJV) Thou shalt not make
unto thee any graven image, or any
likeness of any thing that is in heaven
above, or that is in the earth beneath,
or that is in the water under the earth.

And shewing mercy unto thousands of them
that love me, and keep my commandments.

Commandment #3: Exodus 20:7 (KJV) Thou shalt not take
the name of the LORD thy God in vain;
for the LORD will not hold him
guiltless that taketh his name in vain.

Commandment #4: Exodus 20:8-11 (KJV) Remember the sabbath
day, to keep it holy. Six days shalt thou
labour, and do all thy work: But the
seventh day is the sabbath of the LORD
thy God: in it thou shalt not do any
work, thou, nor thy son, nor thy daughter,
thy manservant, nor thy maidservant, nor
thy cattle, nor thy stranger that is
within thy gates: For in six days the
LORD made heaven and earth, the sea, and
all that in them is, and rested the seventh
day: wherefore the LORD blessed the sabbath
day, and hallowed it.

Commandment #5: Exodus 20:12 (KJV) Honour thy father and thy
mother: that thy days may be long upon the
land which the LORD thy God giveth thee.

Commandment #6: Exodus 20:13 (KJV) Thou shalt not kill.

Commandment #7: Exodus 20:14 (KJV) Thou shalt not commit
adultery.

Commandment #8: Exodus 20:15 (KJV) Thou shalt not steal.

Commandment #9: Exodus 20:16 (KJV) Thou shalt not bear
false witness against thy neighbour.

Commandment #10: Exodus 20:17 (KJV) Thou shalt not covet
thy neighbour's house, thou shalt not
covet thy neighbour's wife, nor his
manservant, nor his maidservant, nor
his ox, nor his ass, nor any thing that
is thy neighbour's.

Hello.

I have a TH 78E (European version) and I have made the beyond MARS mod.
I found this afterwards :

The key combination POWER + CALL acts as a toggle on the CALL key :
Either :
The CALL key has it nominal function
Or :
The CALL key acts as a V/M/C scan initiator (In the manual, it is said to be
possible for US version only)

Does the US version acts similary or is it a specific behavior ?

Thanx.

Vince (Still waiting for the ticket, six weeks...)

Ok, it was a little mistake. It doesn't act as a V/M/C automatic scan, but
a V/M/C switch. I mean if you are using the VCO, CALL switches you to the
CALL channel, then to the most recently used memory channel, then back to VFO.

Also, the combination POWER + DUAL displays something like "SAMPLE". Anybody
knows what it is about ?

Thanks again.

Vince.

While what you say is essentially correct, I caution you about forcing yourself and Christ on others. Christ always did things in love and, yes, we should be prepared for the second coming, we have not done our job here of proclaiming the gospel to every end of the earth. Additionally, no one but the Father knows when Christ will return. We should be centering our efforts on proclaiming the gospel and in obeying the guidance of the Holy Spirit.
Your comment about the Sabbath being on Saturday indicates to me that you are possibly a 7th Day Adventist. DO you realize how inaccurate our calendar is? How many times it has been changed ? Whether the sabbath is Saturday or Sunday is not really relevant. What is relevant is our relationship with Him. Most Christians celebrate Sunday as sabbath in commemoration of the Resurrection.
I think you need to go back to your Bible and prayerfully read it, asking for guidance.
Do not be condemning of others. Demonstrate the love of Christ instead !

From: paulc@fc.hp.com
Message-ID: <CJu6s3.4nD@fc.hp.com>
Source record: 228300

Your 12 volt nicad battery is essentially dead when it hits 10 volts.

Low battery warnings/shutoffs are probably (definitely on the 530) set up for 7.2 volt batteries. When you're using a 12 volt battery, it's long gone when it hits the low battery warning (blinking display).

The voltage display on the 530 is not particularly accurate. Mine's off by 1 volt (the meter reads low) in the 12 volt range. It's consistent, though.

Note that there's no advantage to using a 12 volt 700 mah battery over a 7.2 volt 700 mah battery when transmitting on lower power levels. The radio continues to draw the same current from the battery for, say, the 1.5 watt power level on a 12 volt battery as it does on a 7.2 volt battery (I have measured this). Since the same current flows at a higher voltage and the output power stays the same, the radio just gets hotter. The 12 volt battery does not last any longer. Good for cold winter days...

-Paul KG0CZ

This is normal...this is the default behaviour on most BBSs....

'S' is equivalent to 'SP'...send private.

I routinely make this mistake on full service BBSs, NOS systems, my
own BBS. Makes it real hard to other people to read bulletins, I'm told.

176. Bilal ISOTRON info ?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-18 20:18:30 UTC
From: mosinski@students.wisc.EDU
Message-ID: <51545.mosinski@students.wisc.edu>
Source record: 228304

I am writing to the list to see if anyone is using a Bilal Company ISOTRON antenna at their station. The ISOTRON antennas are compact antennas for restricted spaces and the manufacturer claims the performance of an ISOTRON is equal to or greater than a 0.5 wavelength dipole. I presently live in an apartment (top floor of a two story bldg.) and am using an indoor dipole for HF with fair to dismal results.
Since any kind of permanent outdoor antennas are prohibited by the apt. management, I was thinking I could put up an ISOTRON on a 10-20 ft. mast on the balcony at night and remove it when I'm done operating for the evening. The appeal of the ISOTRONS is their reasonable cost (I know, you get what you pay for) and small size. Any comments from ISOTRON owners would be greatly appreciated.

I just went into massive debt last week by purchasing an Alinco DR600T. I already have performed the mods (blue wire, red wire). I was wondering if anyone had any comments on the rig - performance reports, things that you didn't learn by reading the manual, suggestions, etc.

It sure beats the socks off of the old Kenwood TR7950.

Mike

I realize that this in not a forum in which the advertisement of houses for sale is a generally accepted practice. However, this particular house would be ideal for those who have always wanted a tower to put an antenna on. The tower is a 51' three-section hand-cranked unit. It is mounted on an approx. 6'x3' slab which is as much as 6' deep directly under the tower. It was installed with all the necessary permits. The house is being sold by my parents who have just retired and are moving to the Sierras. I have included the information from the realtor's flyer below:

Unique Home situated on an Extra-Large Corner Lot in the "North Gate" area of Fremont. It's conveniently located within walking distance to schools, shopping, an AC Transit Bus Stop, and just minutes away from I-880, I-84, the Dumbarton Bridge, and B.A.R.T. for the commuter in the family.

Features...
* 4 Bedrooms (1 Bedroom currently being used as a Photo Darkroom)
* Tiled Entry Foyer
* Window Coverings
* Family Room w/ Chicago Brick Fireplace
* Interior Painted Approx. 5 years ago, some areas within the last year.
* Kitchen Includes: Built-In Range/Oven w/New Range Hood, Dishwasher, Tiled Counter Tops, and Dining Area
* 2-Car Garage w/ Auto Door Opener, Some Storage Cabinets & Shelves
* 2 Baths w/ New Sinks, Commodes, Shower Tile, & Lino Floor Covering
* Hardwood Floors Throughout with Some W/W Carpeting & Linoleum.
* Formal Living Room
* Composition Roof 3 Years New
* Extra Large Lot w/ Auto Timed Sprinklers & Drip Water System in both the Front & Back Yards
* Backyard has Patio, Fruit Trees, a Storage Shed and 51' Ham Radio Tower
** Approx. 1504 Sq. Ft. of Living Area **

Asking $219,950

Well of course Rohn sells gin poles and hardware. They're rather proud of them, however, got to pay that liability insurance. I bought a kit from a fellow in the flea market at Dayton last year. Good sturdy construction, but not quite as slickly engineered as Rohn's product. Only cost $49 though, I couldn't build one myself that I'd trust for less. It's your life of course, but Rohn makes the best. Unless you have access to magnaflux equipment, which I do, I'd be somewhat leery of using the product of some garage shop. Fall on your head it might.

> I've noticed that if you send a message to "ALL" in the PBBS, no one
> can read it (or list messages) other than the sysop and the message
> originator.

The default message type for the 'S' command is "Personal" or "send personal", "SP". Personal messages can only be read by the named recipient of the message. (And anyone monitoring the network as the message goes by.) The sysop has superuser privileges and can do anything concerning the operation of a bbs, including read any mail.

If you want to send a bulletin you need to use the "SB" command as you have noted. The bulletin flag indicates that the sender wants the message to be able to be read by anyone. This syntax is very typical of the software design of most BBS programs and other ham packet software. You might disagree with the design philosophy but it is certainly not a bug. This command syntax dates back to the original W0RLI bbs software.

The message type is used to help BBS programs forward mail messages. When personal mail is forwarded it is deleted by the bbs doing the forwarding. When a bulletin is forwarded it is not deleted. It is kept around so that others can still read it.

In the USA we can usually determine good versus illegal callsigns and could probably make some determination. But with world wide callsigns this is not so simple. It is better not even to try. It would be incorrect too many times.

$SOAPBOX ON$

What we really need on packet is to do what USENET has been doing for years. We need to separate personal mail in our own personal mail boxes from news articles. Then we would not need the message type indicators. The packet paradigm of having everything in one big mailbox is just not as efficient for large volumns of traffic.

I can do this with 5W output on my HT into a rubber dummy load. It's
really quite interesting. I think it works because of the energy density,
and gets to ionizing the mercury in one section just about all at once,
and kind of "pops" on.

There is very little advantage to using a tuner on a receiver. (I assume you are talking about the shortwave or lower bands.) Almost any receiver you buy has more than enough sensitivity, so the impedance mismatch between antenna and receiver is not a concern.

Most tuners do provide some additional filtering, so that might be an advantage. However, if you need a filter, you would be better off buying a device intended for that purpose (often called a "preselector").

>I think this was probably just a gimmick to see how much RF is on the antenna.

This sounds likely. Back when I did CB (back when you had to have a license and a call sign) I glued an NE2 bulb to the tip of my antenna. 5W of power lit it up fairly brightly when I keyed the radio.

I got the idea from an ad for something that looked like nothing more than an NE2 bulb in a plastic sleeve for $10 or so.

I'm sure I must have been losing a little bit of power by doing that, but it didn't seem to be significant.

201. Kenwood TH28 strange VFO mode wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-20 06:12:38 UTC
From: cfiler@fraser.sfu.ca
Message-ID: <1994Jan20.061238.9347@sfu.ca>
Source record: 228329

Perhaps someone out there knows how to restore my Kenwood TH-28 to the rather strange mode it was in when I unpacked it from the box. To whit, rather than entering frequencies starting with the 10's of Mhz (Second most significant digit), I had to enter the frequency starting with the most significant digit. The benefit I noted was that the VFO could be set to any frequency in the range 110 Mhz (maybe lower, I never tried that) thru to 148.000 Mhz and probably higher. And while in the aircraft frequencies the receiver automatically switched to AM!

I accidentally reset this mode when I did a full reset on the radio. This must be a keyboard programmable mode that's undocumented, so if anyone knows how to get the VFO back into this mode I'd sure like to hear it.

Thanks in advance

Christine

>feature of the ICOM seriously compromise the selectivity of the
>2m function?

Yes. Wideband receive almost always seriously compromises receiver selectivity in handhelds of any kind. Some are better than others, but none are good in this regard. In particular, the smaller the radio, and the wider the receive coverage, the worse the performance will be from intermod. There are several reasons. First, the small radio doesn't have room for adequate helical filters, and second, it doesn't have the filters anyway because it's trying to imitate a scanner, and third, the small battery requires a very low current drain receiver to achieve long battery life. This latter means that there's only a small standing current in the front end amplifier, thus making it subject to intermod by allowing strong out of band signals to shift stage bias. This is the most critical issue. Since HTs are always power limited, you must have good bandpass filtering to avoid intermod because you can't run 100 ma standing current in the front end transistor. A mobile or base rig can afford to run that much standing current, so it can often get away with wider receive filtering and still be relatively intermod free.

For best results, you need a radio big enough to hold helical front end filters, big enough to handle a high capacity battery, and with narrow enough selectivity to only pass the band of operation. Something like the HTX-202 Radio Shack unit fits the bill best of the current crop of single band radios, but mobile and base size rigs still generally perform much better than any handheld radio. If you *must* have wide band scanning, buy a scanner. Don't compromise your communications radio by trying to make it do something it's not suited to do.

If we'd all write letters of complaint to the manufacturers telling them we want *communications* equipment, not sorry excuses for scanners, to hang on our belts, they might quit making this wide band junk and return to making useful radios. They all know the reasons why wide band receivers are bad in tiny low power radios, but they think that's what we want. Until then, those of us who need communications equipment will just have to keep modifying Motorola HTs, or scrounging old Icom IC2ATs, while the rest of you curse the intermod in your Game Boys.

Gary

204. Dead Icom 551

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-20 15:24:22 UTC
From: hammill@marlins.exide.com
Message-ID: <2hm7n6$5j2@dante.exide.com>
Source record: 228333

I have in my possession an Icom 551 6 meter tranceiver that was made in about 1979. I have heard that the 551 uses a battery backed up RAM to hold its operating program (Firmware????). The rig gives every indication that the battery has died and it has no clue of how to tune or synthesize a frequency to operate on.

Has anybody experience this? Has anybody found a good way to correct the problem? Does Icom fix this?

Thanks for all Replies,
Kd4BFJ

Back in High School, I used to attach a little neon light, like the ones that were in old Magnavox T.V. channel lights. Normally, with 120VAC, 60Hz, these little lights glowed a bright orange.....When I attached one to my 2 mtr antenna, it lit up the back end of my car (No small feat--'72 Plymouth Fury) with a brilliant purple.

People would ask me what that was at stoplights, etc...I would reply "That's radiation, Ma'am", and drive off laughing maniacally..

And they wondered why I was weird...

207. Open up! on the ICOM 2SRA

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-20 17:23:19 UTC
From: chrism@col.hp.com
Message-ID: <2hmem7$p00@hp-col.col.hp.com>
Source record: 228332

I know the ICOM 2SRA has some limitations, and I'd like to hear from as many users of it as possible about these, plus any other comments on the radio. I am about one month away from a purchase.

Things I like: 2m Tx, wideband Rx so I can get NOAA and FM commercial radio, the scanner sounds like a nice feature. Basically I need a radio to keep me company for weeks at a time on high mountains...this one seems like a good match.

If you've used this puppy drop me a note telling me what you like and don't like about it.

Also, if you've seen a price < 519 US that would be nice to know.

Thanks in advance,
Chris Magnuson

Source record: 228336

I have a Digicom DG800 2 meter HT that is around 10 years old (est.).
It is a synthesized thumbwheel style unit. I would really like to get
my hands on a manual, schematics, or any other info on the unit.
I would like to set the deviation properly, but without the schematic
I have been unsuccessful in locating the adjustment. I will be happy
to pay copy costs, postage, and handling.

The actual manufacturer is unknown and the importer/distributor
no longer exists, but the unit works fine.

Please email to: Curtis_Eickerman@email.mot.com

209. Yaesu FT-2200 doesn't get AM

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-20 18:49:04 UTC
From: mozer@jed.atmo.arizona.edu
Message-ID: <2hmjn0$18j@organpipe.uug.arizona.edu>
Source record: 228335

I purchased a new FT-2200 2-m mobile rig last week. One of the
advertised features was an AM detector which would receive the
aircraft band. I was dissappointed to find out that, when I
do the "pushbutton mod" described in the manual, my radio still won't
go below 140 MHz, and doesn't receive AM. The fine print in the
manual says: "extended frequency coverage not available on
some transceiver versions..."

I've been trying to call Yaesu all week about this, but they must
be having earthquake problems because no one answers the phone.

Does anyone know if there is a simple hardware modification which
will turn the AM feature on, or is there no hope for this radio?

210. Re: handheld advice

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-20 18:52:57 UTC
From: spikes@sc.hp.com
Message-ID: <2hmju9$9iq@hpscit.sc.hp.com>
Source record: 228334

Inside the IC2SRA lives two metal boxes. I'm not gonna swear to this w/o looking at the schematic, BUT, it appears one box be the scanner and the other box be the 2m xcvr. The sensitivity of the scanner in the 140~170 Mhz range is not too great. The approx same range on the ham 1/2 is great.

The separate box theory comes from what *I* would do if I were Icom and then sell the boxes separate in two other models of toys.

I asked for emergency reviews of the IC2SRA < a week before Xmas as Ms. Claus promised honey-do tools if I didn't come up with a *need* fast.

I thanked every one whom sent me their thoughts via email. It was all VERY much appreciated. I did get the 2SRA instead of a honey-do tool.

All the reviews and opinions were saved and will be emailed if you ask. There are several pages!

Thanks again to all that answered me before,

Bill

211. Vintage Ham Gear For Sal

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-20 18:56:14 UTC
From: don.merz@radiohobby.chigate.com
Message-ID: <884_9401201730@chigate.fidonet.org>
Source record: 228339

Vintage Communications Gear For Sale and Wanted

CONTACT: Don Merz, 47 Hazel Drive, Pittsburgh, PA 15228
412-234-8819 (weekdays, EST) or 412-344-0956 (eves and WEs to 10PM)

These are the latest additions to a complete list that is posted in
Compuserve HAMNET Library 10 in the file RADIOS.TXT...or available by
mail by sending a 2-stamp SASE to the above address.

National 1-10 receiver. 1947-vintage plug-in coil set covering HF and VHF.
This is a collectors set with a complete set of coils and the incredibly
rare matching power supply. Original manual too. Looks and works as though
it just came out of the box. Fabulous! $399
Multi-Elmac PMR-8 receiver. 160-10 meters. Mobile. 1957-vintage. BRAND NEW
IN THE ORIGINAL BOX. Never installed. Has not had power applied since
it left the factory. $279.
Gonset GSB-100 transmitter. 100 watt, 80-10 meter transmitter with AM, CW and
SSB capability. Near-mint in every respect. No scratches, no wear--a
real beauty. Works perfectly. Original manual. $239
Abbott TR-4. In two years of combing the market, I have seen exactly one of
these ever offered for sale. The Abbott radios were early VHF transcievers
covering the old VHF bands: 5 meters and 2-1/2 meters. When the war broke
out, they were picked up by the WERS--War Emergency Radio Service--as the
civil defense radio of choice. I have two of these, one slightly different
from the other. Both show some signs of wear and have not been tested. No
manuals. As-is. $149 each.
Military TCS transmitter/receiver set. Slightly modified but nothing shows.
As-is. Untested. No manual. $139
Military FRR-21 VLF receiver. This is the shore-based version of the SRR-11.
It looks and works like the SRR-11 radio too. Matches the FRR-22 and FRR-23
sets which together cover the HF band. The left handle on this one is
slightly bent, though hardly noticable. Neat rarity for the military
enthusiast. $179
Meissner 150B Transmitter. 1941-vintage, 150 watt, plate-modulated AM
transmitter originally designed for broadcast AM radio station use but
drafted by the Signal Corps for the duration. CW too. Covers 1500khz
through 12mhz. Uses Meissner Signal Shifter VFO and plug-in coils. This
one includes two Signal Shifters, one complete set of coils and a few
extras and a manual photocopy. Formerly owned by the Chief Engineer of
W1AW, the transmitter has been modified for improved audio. It has several
unoriginal 3/8" holes in the 1/8" thick steel front panel. It measures
40"w x 18"h x 20"d and weighs just over 250 pounds. It is not modular
and could only be shipped at great expense. Best offer over $900.
Multi-Elmac Gear. Classic AM mobile and fixed station equipment from the
50's using a 6146 final to develop 30 watts output. This is all used and

cosmetically good, but not excellent. Manuals included. No Mods. Was working when pulled from estate 9 months ago, but untested since. As-is.
AF67 Transmitter: $129 (2 to sell)
PMR6A Receiver: $99, another one w/cracked plastic dial: $89
PSR6 DC Power Supply: $89
M1070 AC/DC Power Supply (also works with AF68): $139
E. F. Johnson Invader 2000. 1 KW output SSB and CW, 300 watts AM (balanced modulation--not plate modulated). A full gallon in style! When was the last time you saw one offered for sale? Excellent cosmetic and working condition with manual. $1,199
ARRL Hints & Kinks, Volume 2, 1937. No Covers: $4
ARRL Hints & Kinks, Volume 2, 1937. Very good with both covers: $18
Military AN/SRR-13A receiver. 1.5 - 32mhz. AM, CW, MCW. Rackmount in the Navy tilt-over-for-service cabinet. Front panel very good, but has some scratches around the edges, as does the cabinet. 1950's vintage made by RCA. Manual photocopy included. Good working condition: $239
AN/SRR-13A, as above but unworking. No Manual. Complete, unmodified: $105
Military AN/SRR-11 VLF receiver. 0 - 1.0 mhz. AM, CW, MCW. Rackmount in same case style as SRR-13A. 1950's vintage made by RCA. Front panel is very good but scratched a bit at the edges. Case has some scratches too. Manual photcopy included. Good working condition: $239
AN/SRR-11, as above but unworking. No Manual. Complete, unmodified: $105
Manual photocopies separately: SRR-13A: $35. SRR-11: $18.
Military AN/URR-13A VHF/UHF FM receiver covering 220 mhz-420mhz. Rackmount. Very good cosmetic and working condition. $169
Hammarlund HQ-110 receiver. Electrically modified, but nothing shows. Paint is scruffy at the edges, but front panel is excellent and the radio looks good overall. Complete, unworking, as-is: $45

WANT LIST: I am looking for everything listed below for a fair price or trade. Good working condition preferred, others considered. Many Thanks.

WANTED: Equipment
James Millen Company radio equipment, especially...
90881 Power Amplifier
90810 Power Supply
90701 "Variarm" VFO (Note the "01": this one covers 160 meters)
90xxx Rack mount scopes (any size) and sweep units
Coils for Millen R9'er receiver preamp
Millen Plug-In Transmitter Coils: 43660, 43640, 43062, 43042, 43022
43012
Hallicrafters Coils for HT-17 Transmitter. These use 5-pin round ceramic plugs (tube-socket-style) and are marked "Hallicrafters."
Instructograph paper tapes. Need original training tapes and blanks.
WANTED: Military
PRC-64 (Delco 5300) set with or w/o accessories
Delco 1600 and 3200 sets with or w/o accessories
Marine TBX-6 or TBX-8 sets, or other TBX and/or TBX accessories
Marine TBY Accessories: Key, whip antenna, canvas bag, manual copy
BC-611 (SCR-536) Walkie-Talkies w/US Data Plate or parts units
BC-611 Accessories: AT-190 DF Loop antenna, I-135 Test Set

BC-1000 (SCR-300) Backpack set and/or accessories
BC-1000 Accessories: ST-54A Harness, ST-50A Strap, BG-187 bag and contents
PRC-6 Walkie-Talkies w/US Data Plate, H-30 handsets for same, parts
MAB Para-Talkie and/or Accessories
PRC-25 Jeep and Backpack set and/or Accessories
Helmet Radio: PRT-4/PRR-9 and/or Accessories and Helmet!
BC-1306 set and/or accessories
Other portable ground-to-ground sets including GRR-5, PRC-90, PRC-10A,
FM-x, HT-x, BC-728, URC-4, DRF-II or accessories for same
Navy FRR-59A Receiver made by National

WANTED: Tubes
01A 47 83 801 802 6146

WANTED: Miscellaneous
Automatic "RF-Detecting" switch to ground receivers during transmission
Large pre-war transmitting crystals with banana plugs spaced 3/4" apart
(G. R. Type such as RCA TMV 135-A) with frequencies in the ham bands

WANTED: Manuals (originals preferred, photocopies okay)
Yaesu FT221R Manual (Hi and W7FG don't have this one--do you?)
Collins 75A1 Original Manual Only, no photocopy
Millen 90881 Amplifier Manual
Millen 90203 'scope Manual

WANTED: Reference Literature
ARRL Antenna Books, 1st, 4th and 6th editions
ARRL Handbooks: 1926, 1928, 1930, 1931, 1935, 1939, 1941, 1959, 1963
Any 1930s issues of the RCA Review

We do: it is SP vs. SB that *is* that exact separation.
The "P" and "B" are simply tags that indicate into which bin
the message belongs. On this computer here at work, the difference

is that one pile is in one directory (/usr/spool/news), the other
pile is in another directory (/user/hanko/Mail). However, I cannot
access both with the same tool - to produce this message I had to
use a "news tool", but to send you email I have to use a "mail tool".
What a pain.

Most bbs codes provide commands to manipulate the different
message classes in different ways.

IMHO what we *really* need to do on packet is adhere more
closely to RFC-822 (and it successors), where that is appropriate,
and establish a usenet-news-like distribution.

Yes, I know "tcp/ip will solve all these problems."
When it does, I'll use it.

You'll find that using the 2m side of the radio for receiving NOAA stations will prove much more fruitful that using the scanner side. My big gripe about the rig was that the scanner antenna "connector" is none other than a 1/8" mono jack; it is *NOT* a BNC connector. After many months of searching I found a company (Hoesfelt (SP?) Electronics) that sold a 1/8" male to BNC connector, thus enabling one to use "standard" scanner antennas. The stock scanner antenna is good for some things, and quite poor for others. The best rubber suck antenna I've ever used was the one off my PRO-34. I made the mistake of ordering a replacement R-1 antenna thinking it would be an improvement; it was certainly not. Since then I've also purchased an R-1 and found that the stock R-1 antanna is CRAP! Both radios performed much better with my PRO-34 antenna. I would also suggest that when you're using the stock scanner antenna that you secure it somehow. Mine had a habit of falling off, especially when I wore it on my belt under my coat.

On the plus side: since the 2m rig has CTCSS tones, you can also use them on the scanner side and having WFM is nice for listening to TV and broadcast radio as well.

I found it to be a nice radio for the frequent 2m user as well as the avid scanner user.

A simple dipole can be a surprisingly good portable antenna
if used intelligently. By adjusting the location and polarization,
you can often come close to the gain of a small beam. Since
a 2 meter dipole is small and balanced, it usually isn't too
difficult to hold it in the optimum position.

However, a beam makes more sense for setting up long distance
(200 to 500 mile) microwave contacts, where two or more antennas
have to be kept in alignment.

I've found that Cushcraft antennas can be folded into slender poles
if you loosen the elements, rotate them 90 degrees, and retighten
them. Unfortunately, you can lose hardware getting up the mountain.
Of course, many of these antennas can sacrifice an interior director
without losing any gain, so perhaps this isn't much of a worry.

My latest mountaintop antennas are built like the K1FO antennas with
retaining rings. The antennas will not fold up, but littering
the mountain with stainless steel hardware is less of a problem.

217. The differences in CW filter performance

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-21 17:16:54 UTC
From: yee@mipg.upenn.edu
Message-ID: <YEE.94Jan21171654@mipgsun.mipg.upenn.edu>
Source record: 228345
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

When I look at CW filters, I see advertised bandwidths of between circa
250Hz to 600Hz. What are the difference?

218. Motorola MCX100

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-21 17:36:51 UTC
From: wjc@ll.mit.edu
Message-ID: <1994Jan21.173651.23471@ll.mit.edu>
Source record: 228342

I know Motorola made MCX100 radios for the VHF-High band. Were there also Low band and UHF versions, or some comparable models on those bands?

: Conway Yee, N2JWQ

Hi Conway, I have both 250Hz and 500Hz CW filters and I prefer the 500Hz.
The center frequency 750Hz component in the background noise bothers me with
the 250Hz and it does ring worse than the 500Hz filter.
The big boys tell me that 250Hz filters are for "really serious CW".
I'm hardly ever serious.

I also have been eyeing this radio. A friend of mine has one and is happy as a clam with it. He loves showing off the scanner capabilities. The one negative that concerns me is Icom itself. Over the last couple months, I've been trying to decide on an HF rig and naturally I started off wanting to consider Icom. Can you believe that despite FOUR phone calls to their literature hot-line over this period, plus another couple calls to some of their other numbers, I have still not been able to get one single sheet of product literature?!

At one point, I did get an Icom rep on the phone and when I asked him to sell me on his product, about all he could say (this was about the 765) was that it had a great receiver. Pumping him for "tell me more", there was no more. He confessed he really didn't know his competition to be able to compare their strengths. When I mentioned my frustration at not getting any literature, he promised (this was about 2 1/2 weeks ago) that he _personally_ would send me some. Nothing.

Kenwood wasn't much better, though they did send a couple pages (that was it) on a couple of their products.

Yaesu really put out some effort. I called them several times with nitpicky questions on a number of issues and each time was immediately connected to very knowledgable people. For example, when I asked about the CAT (RS-232 control i/f), I was immediately switched over to a fellow who was ready to talk bit-level about how the control packets were laid out. And no problem at all with literature! They sent piles! Even included world time zone maps, etc.

Since then, I've had several conversations with dealers and end-users who've confirmed to me that the impressions I've gotten are not atypical. One fellow told me a story of wanting a part for an ancient Yaesu rig and getting charged only $2 for it even though obviously Yaesu had to do some scrambling to even find it. Another told me a story of frying his mobile thru misuse and getting it fixed (in days!) for free by Yaesu.

As you might guess, I have certainly decided that for an HF rig, I'm definitely going with Yaesu and, in fact, am heading up to HRO in Salem, NH later today to pick up the FT-990. When time comes (shortly :-) for an HT, I admit that the technical features of the Icom unit

(esp. the scanner) may overcome my other concerns about them, but honestly, it does matter to me to be dealing with a company that acts like they really want my business.

If you get some interesting feedback from Icom owners, I'd appreciate hearing a summary if you have time.

Best regards and good luck!

Doug Hamilton hamilton@bix.com Ph 508-358-5715

Two questions folks, is the IC901 still avalible? Is it a good rig? Any problems with it? etc.

Also the FCC opened up some band Do any companys make
handhelds in this range or a HT that can be modded into what ever that
range is. In my understanding of the rules you dont need a license. This
would be ideal for my girlfriend and
I to use while out shopping or caravaning in two different cars..

Id appreciate thoughts on both of the above either public or private..

You're thinking of GMRS - General Mobile Radio Service rigs.

Yes, there are several HT manufacturers. Offhand, I know that you
can get GMRS HT's at Radio Shack, among others.

As for modifying an amateur rig - it's illegal, because the rig
wouldn't be type-accepted by the FCC for GMRS use.

From: arnold@violet.berkeley.edu
Message-ID: <arnold-230194134802@jarnold.cchem.berkeley.edu>
Source record: 228253

I have a Sony ICF 6500W radio that has blown an ic close to the external power socket (9V). The tuner still seems to work, but there's no sound from the speaker or earphone socket. The top was blown off this part. The label on top says: NEC JAPAN, C1213C, L16C. It has four 'legs' on each side, with the last one being much wider than the other three. As you can tell, I have no clue what this is, but if I can find a replacement I'll solder it in and see if this fixes the radio. Any info as to what the part was, and where I might get hold of a replacement would be appreciated. Thanks, John.

I don't have posting priveleges for rec.radio.swap at my site, so I'm posting to this group. I have a Heath HW-99 CW transceiver from the mid 1980s for sale. This unit covers the bottom 250 kHz of 80, 40, 15, and 10 meters. Its maximum RF output is 50 watts, but can easily run at the mW level. All solid state, this is a great radio (Field day, first station, etc.). I'm moving and I need the cash. I'm looking for $199 and I'll ship anywhere in the lower 48. Manual is included.

Vintage Communications Gear For Sale

CONTACT: Don Merz, 47 Hazel Drive, Pittsburgh, PA 15228
412-234-8819 (weekdays, EST) or 412-344-0956 (eves and WEs to 10PM)

These are the latest additions to a complete list that is posted in Compuserve HAMNET Library 10 in the file RADIOS.TXT...or available by mail by sending a 2-stamp SASE to the above address.

Seeburg jukebox extension speaker. The famous Seeburg teardrop model CV54-8. Pink (or peach?) speckle finish with the word "Seeburg" printed across the grill cloth. Looks and works very good. Should clean up to like-new. $89
Motorola TC-101 UHF TV converter. Some scuffs on original wooden case, but still nice. $13
1957 Eico catalog. As-new: $9
1956 Eico brochure set. As-new: $4
1957 Grommes (Precision) catalog. Large, 3-color. Excellent: $9
1957 Grommes (Precision) catalog. Small, B&W. Excellent: $7
Knight-kit 5 tube AM radio assembly manual. As-new: $4
1971 (?) Panasonic catalog. As-new: $2
1948 Surplus Radio Conversion Manual, Volume I. By Evenson & Beach. Published by techno-graphic publications. Excellent condition. This volume is getting mighty tough to find. $29
CQ MAGAZINE: 1945 issues: July, August, September (2): $7 each
CQ-DX Annual. 1948. 1st Edition, 1st Printing. $23
ANTIQUE TV SERVICE LITERATURE: 110 pounds of antique TV service docs including 6 volumes of Riders TV Manuals, service guides from RCA, Dumont, GE and Philco. Hundreds of issues of Circuit Digest and MUCH MORE! Take it all shipped to your door for $75 (includes shipping).
SAMS PHOTOFACTS: Over 150 complete photofacts and over 100 partial sets--fills a four-drawer file cabinet. Numbers range from 100 up through about 450. Take them all for $109 shipped to your door (price includes shipping).
Hallicrafters HT-18 transmitter. Missing a knob. Otherwise very nice. $69
National HFS receiver. 1949-vintage plug-in coil set covering 27 - 250mhz. AM/FM (slope-detection)/CW superregen set. With all coils, matching 5886 doghouse power supply and original manual. Front panel is very good, but the paint is smudged and scruffy in many places. Has several scratches on top too. Works perfectly. $169
Multi-Elmac PMR-7 receiver. 160-10 meters. Mobile. 1957-vintage. BRAND NEW IN THE ORIGINAL BOX. Never installed. Has not had power applied since it left the factory. Mint. $279.
Multi-Elmac PSR-612 power supply for PMR-7 and other Elmac radios. This is the mobile supply that works on 6 or 12 volts. BRAND NEW IN THE

ORIGINAL BOX. Mint. $99.
Gonset GSB-100 transmitter. 100 watt, 80-10 meter transmitter with AM, CW and SSB capability. Near-mint in every respect. No scratches, no wear--a real beauty. Works perfectly. Original manual. $239
Abbott TR-4. In two years of combing the market, I have seen exactly one of these ever offered for sale. The Abbott radios were early VHF transcievers covering the old VHF bands: 5 meters and 2-1/4 meters. When the war broke out, they were picked up by the WERS--War Emergency Radio Service--as the civil defense radio of choice. I have two of these, one slightly different from the other. Both show some signs of wear and have not been tested. No manuals. As-is. $149 each.
Military TCS transmitter. Slightly modified but nothing shows. As-is. Untested. No manual. $89
Military FRR-21 VLF receiver. This is the shore-based version of the SRR-11. It looks and works like the SRR-11 radio too. Matches the FRR-22 and FRR-23 sets which together cover the HF band. The left handle on this one is slightly bent, though hardly noticable. Neat rarity for the military enthusiast. $179
Meissner 150B Transmitter. 1941-vintage, 150 watt, plate-modulated AM transmitter originally designed for broadcast AM radio station use but drafted by the Signal Corps for the duration. CW too. Covers 1500khz through 12mhz. Uses Meissner Signal Shifter VFO and plug-in coils. This one includes two Signal Shifters, one complete set of coils and a few extras and a manual photocopy. Formerly owned by the Chief Engineer of W1AW, the transmitter has been modified for improved audio. It has several unoriginal 3/8" holes in the 1/8" thick steel front panel. It measures 40"w x 18"h x 20"d and weighs just over 250 pounds. It is not modular and could only be shipped at great expense. Best offer over $900.
Multi-Elmac Gear. Classic AM mobile and fixed station equipment from the 50's using a 6146 final to develop 30 watts output. This is all used and cosmetically good, but not excellent. Manuals included. No Mods. Was working when pulled from estate 9 months ago, but untested since. As-is.
AF67 Transmitter: $129 (2 to sell)
PMR6A Receiver: $99, another one w/cracked plastic dial: $89
PSR6 DC Power Supply: $89
M1070 AC/DC Power Supply (also works with AF68): $139
E. F. Johnson Invader 2000. 1 KW output SSB and CW, 300 watts AM (balanced modulation--not plate modulated). A full gallon in style! When was the last time you saw one offered for sale? Excellent cosmetic and working condition with manual. $1,199
ARRL Hints & Kinks, Volume 2, 1937. No Covers: $4
ARRL Hints & Kinks, Volume 2, 1937. Very good with both covers: $18
Hammarlund HQ-110 receiver. Electrically modified, but nothing shows. Paint is scruffy at the edges, but front panel is excellent and the radio looks good overall. Complete, unworking, as-is: $45

CH> radio to keep me company for weeks at a time on high mountains...this
CH> one seems like a good match.

CH> If you've used this puppy drop me a note telling me what you like and
CH> don't like about it.
```

I used one and then got the W2 because the latter is dual band. In
retrospect, I hardly use 440 and should have kept the 2SRA because it
is a better wide band receiver than the W2 and even uses a separate
wideband receive antennae. The only complaint i have with both rigs
is the tiny and numerous buttons. Performance was excellent...few
birdies, sensitive (especially in the cellular and air bands) and
rugged (diecast aluminum case).

Hi, I have got extended coverage recieve on my TH78, but does anybody know if it is possible to get it to RX FM below 108 MHZ.

Also does any body know if it is possible to get it to 'crossband repeat' in the same band?

Can it be used to decode DTMF tones simply to thge screen or memory as number eg to decode telephone numbers.

Has anybody managed to use the CLONE feature to record the memory settings oto a tape say as a backup for the memory 250/125 memories is a lot to reprogram!

Cheers Paul

244. FOR SALE:Z-100 computer - "Good packet radio terminal"

>would be ideal for my girlfriend and
>I to use while out shopping or caravaning in two different cars..

You're probably thinking of GMRS around 460 MHz. The FCC did *not*
recently open this band up to unlicensed use; you need to file a form
570 with $35 for the GMRS license. You are licensed for all GMRS
frequencies when you do this; you do not pay NABER for frequency
selection.

The only unlicensed band, other than Part 15 bands, is 27MHz CB.

Oh, yeah, you aren't permitted by law to use a non-type accepted
radio on GMRS. That means an opened-up ham radio is not legal.

I am in the market for a new or used 1.25m HT.

I am a college student, so a low price is desirable.

The features I mainly want are: PL (CTCSS) encode and decode, DTMF
keypad, and digital tuning.

I am eyeing the ICOM IC-3SAT for its size and built-in DC direct jack.

If you have a 222 Mhz HT for sale, please let me know.

I can be reached via the following:

- wy1z@neu.edu [Internet]
- via a direct reply to this message (but not to the newsgroup)
- via phone: 617-373-4198 [Northeastern Univ. Ham Radio Club -
w/answering machine]

Thanks much!

I have been using the Alinco 580 for several months. I like its backlit keypad, wide scanner, easy mod, and price. I don't like the fact that I keep having to turn the volume down completely because of what appears to be intermod racket coming through it. Even walking out in the country, 10 miles from a small size city (pop. 50,000),the radio has to be shut down very often in order not to bother everybody else around me.

You can apparently have the sensitivity reduced by 2 db and this would reduce the severity of the problem. BTW my Icom radios never show such a problem, unless I have a high gain antenna hooked up to them.

A friend had a serious problem with his 580: It nearly caught fire. He sent it about 2 months ago and it is still not back. Part of the problem is the fact that they insist, by mail, for prepayment of all repairs, and you have to send a check as they don't accept phone call payment by credit cards. This is one problem you don't have with Icom,not that Icoms do not have problems:-)

I can't tell you anything about the other radio you are interested in.

Hi,

Can anyone tell me how to change the narrow and wide IF filter
inside the ICF-2010? What kinds of filter can I use? Can I use filters for
say the ICOM (FL-series) or Kenwood. 1) Will these work, 2) Will these fit?
I heard of the Kiwa filters for the 2010 too.

In general what kind of improvement can I expect out of using such
filters?

Can someone direct me to any sites where I can find out what kinds
of mods are available for the Sony ICF-2010/2001D? Tks.

Sold for a brief period in 1982-1983. It was reviewed in QST 9/83.

>
>Anyway, whats the low down on this rig? Is it a good one, did
>people have problems with it, how do you like yours???
>

It is a very nice radio. It has a good receiver with MDS of -141dbm
and DR of 125db on the 20m band. It is a very compact rig.
I think that it is a better buy at $450 than some of the low end hf rigs
on the market now. Many options such as 270Hz filter, keyer etc
(other than 500Hz filter and internal ps) are still available from dealers.

I owned one for a few months. I upgraded to a Kenwood TS850s. I know of
few hams who still use one and like it.

From: eesnyder@beagle.Colorado.EDU
Message-ID: <eesnyder.759603073@beagle>
Source record: 228283

I am currently in the market for a Dual-Band (VHF/UHF) mobile rig for a vehicle. I would like >=50 watts on VHF as well as cross band repeat capability and the ability to change said frequencies remotely. Any recomendations? I am partial to Yaesu (love my FT-530!) but will consider anything that foots the bill.

Also, are there any other features that are worth thinking about? From what I can tell, all they major manufacturers seem to offer very similar products. Does any one radio stand out as being significantly more "feature laden"?

Message-ID: <1994Jan26.170531.11540@es.dupont.com>
Source record: 228285

Bruce,

The Icom 740 was one of the last "ham bands only" rigs that Icom offered during the mid 70's. It was the predicessor to the IC-745 (which was the same basic rig but with a general coverage receiver installed). The rig I have is loaded with all the options, and I like it a lot, especially the filtering and the PBT/IF shift. The rig I have also has the internal power supply installed which makes it one neat package. I've had a lot of the other rigs on the market on and off, and think that it's a good one, the only thing(s) that it doesn't have available are AM operation, and memories, but overall, I think it's a real good rig for general operating, DX'ing and contesting. One other thing you should know is that the SWR protection circuit does roll back the power pretty quickly if the SWR gets much above 1:5/1, so you may want to keep a tuner in line with the rig.

Good Luck,

Joe

261. htx-202 or dj-162 ?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-26 17:12:25 UTC

I have pretty much narrowed down my choice to these two 2m ht's.

I'd like to get comments and opinions from people in the net who
have actually used both.

currently, I am leaning towards the dj-162 because of its wide
receive.

please email responses if possible.
thanks in advance.

jerry

262. Any views on ICOM IC X2A? It's about $305

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-26 17:58:27 UTC
From: drawson@Tymnet.com
Message-ID: <2i6b03$l9k@tymix.Tymnet.COM>
Source record: 228213

I was starting to look for an HT for 1200 MHz, and found these choices:

ICOM 12GAT (2AT size class) $444 discounted to $419 at C-COM

Yeasu FT911 $469

Standard 628A (440 and 1200) $570

ICOM X2A (440 and 1200) $495 (discounted to $330) at C-COM,
470 (discounted to $305) at AES
with an ICOM $130 discount coupon -- offer through March.

So the X2A looks interesting. But I haven't seen it, or heard whether
it is a competent radio. Can anyone say?

KD1HZ and I both own, between the two of us: 3 FT-5100's and an FT-5200. The 5100 is a good radio for the money. The only thing it can't do is remotely change frequencies. Ah well...

Source record: 228286
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

A group of students at the engineering college here are looking for
a used Travelling Wave Tube for a communications project. The operating
range of the tube should preferably be in the 7GHz to 12GHz range. Because
of license restrictions, most work will most likely be in the X-band
range. A tube with a waveguide input/output is preferable. The power
supply is not necessary but would be nice. A power output of 1W to 10W
would also be nice. So if you have any collecting dust in the basement,
please contact me! (Or, if you know where I can get one, we will gladly
pay a finder's fee).

And before any of you greedy people start seeing money signs in
their eyes, let me warn you: A solid state amplifier in the above range
with a 10W output and coax in/out costs $795 from Micro-Circuits. We are
looking to spend half that or less.

Also, some people in the physics department are looking for old
klystrons, gyrotrons, magnetrons, etc, if anybody has any of those lying
around. (I think they would prefer klystrons because they have power
supplies for them.)

A big Thank You to anyone who can help.

268. Re: Info on ICOM IC-740

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-26 22:31:44 UTC
From: morris@ucunix.san.uc.edu
Message-ID: <2i6r0g$lpl@ucunix.san.uc.edu>
Source record: 228290

I like my IC-740 a lot--picked it up used at Dayton last year (-:

Mine has both of the CW filters which makes even field day manageable (!). The only thing other IC-740 owners and I have complained about is the receive audio--a bit bassy w/not enough highs. We usually listen with the PBT/IF Shift tweaked just a -smidge- off center to make the audio a little more readable (It can't be my aging ears...).

I've just picked up the electronic keyer for it but haven't installed it; next shopping trip to the candy store (R&L in Hamilton, OH) will be for the FM unit for 10M. The only other thing I could want would be a narrower filter for SSB, but I have the impression (if wrong, netters, please correct me!) that if you have both CW filters you only get one SSB filter, and vice versa--so I've opted for the 2 CW filters vs. 2 SSB filters.

I miss my TenTec Triton 2 but I really enjoy the additional flexibility of the IC-740 (notch, pbt/if shift, two VFOs, etc.). Oh yeah, mine has the internal pwr supply option already installed, too, for 110V operation.

Enjoy!

I love my FT-530 also, but in the car I have a Kenwood TM-732a.
Although if I were to do it over I'd get the tri-band TM-742a.

I also have an old Icom dual band mobile to sell but it is quite
primative. 10 memories, 25 watts, no wide band etc.

Hi, folks,

I am a beginner in Ameteur Radio, and I am preparing to pass the none-code technician licience. I really need a 2m hand held radio to get in touch with the air.
Since I am a rockie on this area, I don't want a high-end or expensive model, a nice clean used(3 to 5 years) will be most suitable for me.
If anybody has a spare 2m hand held radio for sale, I will offer 100 - 130 bucks plus shipping.

Please contact me at ruentien.lu@corp.sun.com

271. Kenwood TH-28a & Competition

Newsgroup: rec.radio.amateur.equipment

From: ssyck@csd4.csd.uwm.edu
Message-ID: <2i7bmdINN5td@uwm.edu>
Source record: 228294

I am very new to radio and have a few questions about radios.

My friends who got me into this all have Kenwood TH-28a's (about 5 of them) and they are encouraging me to get the same. They tell me that this radio is the greatest thing since sliced bread, but before I plunk my $300+ down on one I would like to seek the net.wisdom.

A few questions:

1. Is this radio as good as they tell me?

2. What is its competition, and how do they stack up against it?

3. Is there anything that does everything the TH28a does, and maybe more available for a similar price?

4. Would you suggest something different?

I really don't know a whole lot (obvious isn't it?) about these but what I do want is a handheld which has an external jack for a VOX headset and something that will do everything the TH28a will. Email or responses here would be fine.

Thanks for the help

Steve Syck ssyck@csd4.csd.uwm.edu

>From what I can guess, and my dealer's comments, this is probably
>NOT a unit imported into the US, and probaly either European
>or Canadian frequencies..

Actually, the radio is an American radio.....what you have there is a
DANG GOOD handheld! How much did you pay for it? I'd love to get one at
a garage sale!

The FTH 2070 is the only commerical dual band handie talkie on the market
that I know of right now.

The frequency coverage is 138-174 and 400-512. Options for the rig include
speaker mic, jerk-and-run charger, DTMF pad, IMTS phone capability, 2 tone
decode, and slew of others...

It's a fine rig! It's computer programmed....

I wish I could be so lucky!

miracle baby antenna

Yeah, I had one for two days. It's a "miracle" if you can hit a repeater
next door. :-)

It's a piece of crap, I ended up getting an alinco 580 antenna. Which I
use when I want a short antenna, I usually use a Diamond RH-77 at other
times. The stock antenna (ft-470) is a bit longer than the 580's and
doesn'tgive noticably better performance.

good luck es cheers,
Dan

276. DSP-9 Filters (and others) -- New Thread

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-27 13:39:12 UTC
From: root@jackatak.raider.net
Message-ID: <24cTgc1w165w@jackatak.raider.net>
Source record: 228219
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

The thread of DSP-9 (etc) Digital Filters and bandwidth/ringing has pretty well wound down, and while I do not mean to fire that discussion up, I am seeking information on a different aspect of these lovely little devices:

Several hams using these filters have reported problems, both on the Nets and to the manufacturers, when engaging both the Heterodyne (tone) processing filter *AND* the random noise filter. The audio becomes distorted.

A Ham from Louisiana offered the suggestion, that had been offered him and seemed to work well, that the unit would work OK if the operator would simply turn off their tranceiver's speech processor.

There followed a VERY heated argument about how the speech processing circuit processes OUTBOUND audio only and has NOTHING to do with the INBOUND audio going to the processor. However, when the (RF) Speech Processors were turned off, the DSP-9 (and DSP-59 and a few other brands as well) *ALL* responded as they were supposed to...

The question was immediately raised: "What could the (RF) speech processor have to do with the incoming audio?"

I speculated, and am seeking confirmation here, that the *RF* speech processor circuitry is engaged all the time the "compression" button is engaged, that unlike the final amp which is biased to cut-off, the speech processor runs, with no input, all the time. This would explain why the simple turning-off of the processor eliminates the problem, as does moving the DSP unit OFF the top of the radio and placing it a few feet away.

A glance at the block diagram of my rig and a quick look at the schematic seems to bear this hypothesis out, but I am still unsure and seek additional input and thought...

The real motive is: I have a DSP-9 that I intend to install in my mobile, but I have NO CHOICE about where to position the unit -- it MUST go right on top of the transceiver or not at all. I do NOT use a speech processor for a variety of reasons, but some of my co-pilots do...

So, anyone care to show me the error of my thinking? Confirm my wild-ass guess? Hit the "N"? Add me to the .killfile?

I'm interested in starting a few electronics projects, but need to find a good source of electronics parts. Now don't tell me to go to Radio Shack! Their selection is *very* limited. For example, I need a toroid core to wind a transformer, but Radio Shack doesn't carry anything like that.

So, are there any *real* electronics stores in the Washington, DC area that cater to electronic hobbyists?

It depends. If you throw them overhand, they'll sail about 50 feet.

Grab hold of the mike, and swing it around and around by the cord, and
it'll go almost 100 yards.

: I am interested in hearing from people who have used or the
: miracle baby antenna : from comet. I of course realize that this
: antenna will not be a great performer : b/c of its size, but I'm
: curious none the less about its performance.

It is pretty worthless in the two meter band, but is fairly
tolerable in th 70cm band, and quite effective up around 800Mhz.

I use it as a mild attenuator on two meters, or for near-field
simplex work, like when a group is at a theme park, or when I'm
working my remote base from somewhere on my property (~50acres).

But up around 900Mhz, it may be the most effective antennae I
own. (not saying much, as I have no equipment there, and am
going by scanner reception with various antennaes)

It's great for working my remote, as the radio and antennae do
not get in my way while working. Should also be great for
clandestine work... but don't expect much on 2m.

Wide receive is literal for all this class of radio, they tend to be very prove to losing the ability to hear an Amateur band signal when there are strong out-of band signals about. The only cure is having tight filtering around the amateur band, and this precludes wide range reception.

You'll not be far wrong if you think of them as a box containing 3 things:

1) a "scanner" with performance that places it at the cheap end of the scanner market, and less frequency coverage than usual.

2) A reasonable quality amateur band transmitter.

3) An amateur band receiver with only the performance of a cheap scanner, that is very susceptible to strong unwanted signals.

There are many people who have these and are delighted with them. Possibly due to being in areas away from non-amateur transmitters, or perhaps because they don't know what they've missed because they never heard it....

The Tandy hand-held may now be the only amateur hand-held that has not seriously compromised its performance as an amateur band radio.

I understand that some hand-helds now have computer game modes. Could they have been included to give the user something to do while in areas where blocking is frequent?

Ok, I've got strong opinions in this area, but if scanning was your prime interest, you probably wouldn't have got a licence.

If you can't hear 'em, you can't work 'em. whoever said it first is probably long dead, but it is still true. Also don't you just always lose contact just at a critical point in a talk-in etc.

Cheers
David

I have a Motorola Mostar (VHF Hi, presently on 153 MHz) that I need reprogrammed, and neither the local dealers or the local Motorola service center have the interface box and the software to do it. (Some have the software, others have the RIB, and no two will get together to get the job done. Ugh!)

If anybody out there in netland would be willing to burn a PROM and mail it to me, please drop me a line. There'd certainly be the cost of the part plus a few bucks in it for you. (And yes, I know the receiver needs to be opened up a bit to cover the entire 2m band.)

Yeah, that's a trick used in the field to see if the antenna has an SWR of
less than 2.

I don't know the range of antennas that it would work on, but I've seen the
trick used on CB, 2m and 440 antennas (same bulb, different antennas).

290. Variable capacitors... help!

I have gotten a maximum range of about 500 feet out of my Radio Shaft CB,
but I had to use a catapult to do it.

A friend of mine had better luck using an inner tube from a tractor tire
tied between 2 stumps. Range was easily 800 feet or more.

Another friend was less successful with his attempt at using booster
rockets attached to his old Navaho 23.

I suggest you buy the most expensive CB that they sell.

|> my $300+ down on one I would like to seek the net.wisdom.

The TH-28A works especially well with other TH-28A, so it would make sense
that if your friends have chosen it, it would synergize well with them.

For example, each member of your informal group can have an ID code, and you
can send alphanumeric messages to each other or to the group, whether you are
at the radio or not.

You can have a group DTMF squelch break code, so you can monitor a frequency
without the radio making a noise unless someone keys up and sends the DTMF
squelch break code.

Other niceties include:
- 6 character alphanumeric description for each of 20 programmable channels
(e.g. the repeaters show up by name/location rather than 146.999)
- It can be modified to pickup 360 to 520 Mhz, so alot of police stuff can
be found (and you can scan the set of non-scan-locked-out programmed channls)
(the mod, though of little use, expands the RX+TX range from 136 to 170 Mhz)
- It can pick up aircraft at 118-136 using AM.
- Since it receives 440 Mhz, you can use it for split band operation (e.g.
transmit on 2M, recieve on 440 band) with no problems.
- It's a cute little easy to carry package with a good reciever.
- It has several scan modes, a clock with alarm, a lots of options to add on
later.
- It has a bazillion functions.

Bad things about the radio:

- It is pricey-er than the bare bones models.
- The channel scan mode is too slow (about 2 or 3 channels a second)
- It has a bazillion functions.

I like mine.

Close, it has 16. I have a HTX-202 and it is one sturdy radio. I've
dropped it several times (once while coming out of the attic after installing
a 2M antenna) and have had no problem with it. I love my brick and would
not trade it in for anything! It is great for packet, with the mag-mount
antenna it goes moble, and with a simple 1/4 wave ground plane antenna it's a
base station. When I use a 12v regulated power supply, I get almost 9 watts
out on high. It is definitely worth it.

just my humble 2 cents worth.

I thought that it has more to do with the way in which the de-noiser and
the auto-notcher work. Crudely spreaking, the auto-notcher removes the
parts that are highly serially correlated and the denoiser removes the
parts that are least serially correlated. Both of these depend on the
time serial correlation characteristics of human voice. But this can
change with fast fades. Hence the problem.

I have a Digicom DG800 2 meter HT that is around 10 years old (est.).
It is a synthesized thumbwheel style unit. I would really like to get
my hands on a manual, schematics, or any other info on the unit.
I would like to set the deviation properly, but without the schematic
I have been unsuccessful in locating the adjustment. I will be happy
to pay copy costs, postage, and handling.

The actual manufacturer is unknown and the importer/distributor
no longer exists, but the unit works fine.

Please email to: Curtis_Eickerman@email.mot.com

297. An antique miniature radio....Neat story

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-28 16:54:53 UTC
From: CCCATHY@mizzou1.missouri.edu
Message-ID: <16F4C997DS86.CCCATHY@mizzou1.missouri.edu>
Source record: 228226

In 1942, my Grandfather, who was living in Southern France, joined the French Underground. The Allies would airdrop supplies to the Maquis, and my grandfather, received in one of these shipments a radio that was the height of American technology and miniaturization at the time. It's about 12" X 5" X 5" with a grey metal casing and a minimum of dials (one for frequency and one for volume). It came with headphones, and three modules that plug into one end. One module would convert it to shortwave one to AM and one to FM. This was way before microchips and the radio weighs at least 5 pounds. It has 5 vacuum tubes in it AND IT STILL WORKS! We had to have it repaired recently, and the electronics repairman who did the work put a transformer on it to keep it from ruining the tubes again. Anyway, we've been able to pick up broadcasts from all over the world with it. It's REALLY neat.

Anyway, when Grandpa immigrated to the U.S., he brought the radio with him and kept it all these years. He gave it to my brother for his 10th birthday last August. I just thought it was a neat story.

I assume you already know this, but in case you don't own the 2SRA yet, let me
say that the receive side of the radio has a 1/8 inch earphone type antenna
connector and not a BNC. If you have an adaptor 1/8" to BNC that won't
make the antenna flop over, I'd like to hear about it.

I think you can assume it would never be greater than the rig's power supply (12V) and probably never more than a few milliamps (less than 10 mA or so). If in doubt, it's easy to measure.

Older tube-type rigs usually used grid-block keying that could go up to minus 100V or so at less than a couple mA. Some REALLY old rigs used cathode keying that could go up to plus several hundred volts at a good portion of an amp. You didn't want to touch the key contacts on one of those babies!

The X2A looks just like the W2A or 2SRA. It has all the normal bells and whistles that modern HT have. I seriously thought about this radio for a while but at the time it was $500. $305 is an incredible price for a dual band radio, especially one with 1.2GHz. I would love to get one but now I live in an area that doesn't have 1.2 activity.

306. AR1000XLT for sale

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-29 00:30:47 UTC
From: mjr@crl.com
Message-ID: <2icann$hkg@crl2.crl.com>
Source record: 228221
Cross-posted to: rec.radio.scanner,rec.radio.amateur.equipment

I have an AR1000XLT I will sell for $275.

It is in perfect condition, used for about 1.5 years, and tuned about
6 months ago by ACE. It works great given the general limitations of
this particular model.

General characteristics:

1000 memory channels in 10 banks. 10 separate search programs also
can be stored (one per bank). The bank capabilities are very
flexible. For example you can program it to scan or search the
channels (or search ranges) programmed into several banks
simultaneously, even skipping banks in between, etc.

It's ostensible range is 500Khz to 1.3Ghz. There are no gaps. Nothing
is locked out. Bear in mind the unit is effectively useless below
30Mhz unless you can put a Loooong antenna on it... Above 30Mhz though,
it is pretty good. ..

It does AM, WFM, NFM modes. Any step increment from 5khz to 995khz
can be selected on any band. Unlike some scanners, it will not lock
to a particular even-increment when stepping. So if you start at
xxx.112Mhz and give it a step of 30khz, the next freq it will hit
will be xxx.142Mhz and not xxx.140 as with many other scanners.

All-in-all a very powerful scanner at $275 in prime condition. I also
have a copy of H. Bornstein's GUIDE TO THE AR1000 I will throw in
with the deal, along with all the original documentation and purchase
receipts.....c

If you are interested, call me at work (Larkspur CA) at 415 461-6790
or send mail to me mjr@crl.com

Happy scanning...

Are there any tricks on finding affordable spectrum analyzers? What is the reasonable price range for them? I've seen a few advertised in ham radio catalogs, but they don't seem to be listed in the usual electronic equipment catalogs.

I'm curious mostly for my own edification, rather than for immediate purchase.

Jerry, I myself have used both and found the DJ-162 all around better in its operations as well as its structure. The HTX-202 has no Mod info and is virtually an unknown radio internally. Maybe time will change that, but meantime technology moves on.

Steve Whitt mentions a rather detailed (but simple) fix in his book involving replacing or adding 3 or 4 capacitors in the radio's IF section. It DOES involve moving a shield and some pretty detailed solder work so it isn't for the feint of heart or those with limited soldering experience though!

Has ANYONE reading this group done the mod to see how it performs? I haven't yet -- and have been trying to see if anyone else has before I tackle it to see if it really does make a difference. I have been getting more and more annoyed by the background "rumble" on 49 metres in the evenings here, and would like to try the mod sometime t see if it helps.

Hi,

I have a 2m FM PLL transceiver model FDK MULTI 800-D. It was manufactured
by Fukuyama Electronics Co., Ltd., Japan.

I'd like to use it for packet radio but I am missing the manual.
Could someone be kind enough to xerox it for me (I'll naturally reimburse
all the expenses). I am particularly interested in the pinout of the
external 24-pin connector identified as 'ACC'.

Moreover this TX is configured for region 1, ie it works only from
144 to 146 Mhz. I know that it is possible to modify it to work from
144 to 148 Mhz, but HOW ?

Any help will be greatly appreciated.

I find that if you drive over them back and forth a few times and
spray paint them orange yellow,they make pretty good frisbees, with
a range of a 100 feet or so, depending on the wind and your own
skills, of course.

312. Q's on Ni-Cd batteries- Yaesu FT-411E

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-29 19:19:04 UTC
From: adamstr@cc.uvcc.edu
Message-ID: <1994Jan29.121904.1@cc.uvcc.edu>
Source record: 228220

I have a question about Ni-Cd batteries for a Yaesu FT-411E. The radio came with the FNB-17 pack (7.2V 600 mAh). I'm planning on upgrading to a battery with more capacity which would provide more output as well (5 watts). According to my operating manual, I could use either of the following:

FNB-11 12V 600 mAh
FNB-12 12V 500 mAh

Could someone please tell me the difference between these? Is one better than the other? I've also noticed in the winter '93/94 version of the Amateur Radio Catalog that there is an FNB-12S 600 mAh (5w) battery available. Is this one perhaps a replacement for one of the above?

And finally.... Although the operating manual states that batteries providing power output at 5 watts are available, I have heard that operating at 5 watts can cause a radio to 'heat up' and could possibly cause damage. Should I stay at a lower power output and perhaps use an antenna that provides better gain to make up the difference?

Any comments/suggestions are welcome. Please e-mail since I don't get a chance to read the net on a regular basis. Thanks!!

Tracy KB7YAP.

314. Semi QSK on Atlas 350XL

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-30 13:35:19 UTC
From: cal@ccd.harris.com
Message-ID: <1994Jan30.133519.28623@ccd.harris.com>
Source record: 228239

I am relatively new to amateur radio. Last August I got my Tech+ and last month I upgraded to Advanced. I've really been interested in HF CW. I bought an Atlas 350XL at a hamfest a couple of months ago and have tuned it to work ok, but while transmitting I often get a Vox feedback that keys the transmitter. No setting of anti-vox, vox gain or delay seems to prevent this. Also, the semi breakin mode does not work at all. The manual mentions that some older 350's do not support semi-QSK and that if you have one to "contact the factory". I can only guess that this means there is a bug in the design.

Does anyone out there know of the design error and/or what the mod is to correct it? I have a feeling that my feedback problem is related to this defect. Any help?

Carl Letter, KE4GQA/AA

AS>filters?

AS> Can someone direct me to any sites where I can find out what kinds

AS>of mods are available for the Sony ICF-2010/2001D? Tks.

Kiwa sells filters for the 2010 and can be reached at 1-800-398-1146.
The prices is 14 and 40 dollars for the wideband and narrowband mods,
respectively. The filters have zero insertion loss so overall signal
strength is increased since the stock filters do insert loss.

>It's unfortunately true. The 71's ram is factory programmed and is kept
>alive by the battery. When it goes, the radio cannot reset itself so
>nothing comes up.

You can replace the battery `live' (Power On) if you have an isolated tip soldering iron. My radio has not aged enough, but N5OFF/Thomas Marcotte did this on his 751.

If you are truly leary, you have options of building your own programmer/reader for the unit (I used a microprocessor to read/write my '751's memory, but a set of dip switches and buffered lights could be done if you are microprocessor challenged ...), ICOM can reprogram it for you, and some dealers will be able to change the battery and either retain the program, or re-program it.

>Since the batteries last about 5 years, the average life of the rcvr, Icom
>didn''t worry too much about it.

First off, it has a 10 year life, second, why should ICOM worry about it, so you lose the radio while you fall victim to a standard procedure to replace the battery and/or and reprograme the memory, why would this be a big deal?

In addition, re-programming the unit *can* be an opportunity to extend the frequency range of operation up to 39MHz and alter other characteristics, do you have a problem with this gold mine of opportunity, or did you want a Kenwood with a 3 year lifespan and a VCO that doesn't stay in lock because of the phenolic PC board cracking it's coils ...

>You'd thinkthey would have issued a retrofit
>eprom but no such luck. Let me know what you find out on this one via
>e-mail or here, I have a personal stake in your findings hi hi.

There are aftermarket RAM extension modules that you may be interested in, Contact N5OFF at tfma@chevron.com or n50ff@w5ddl.aara.org and ask him what he feels about it (QST just rejected his article about one of these add-ons suitable for R71/R751 series of rigs).

From: angerhof@bambam.es.com
Message-ID: <2ik4f0$at5@orca.es.com>
Source record: 228149

I would like to run my FT-530 from the 13.8v DC coming from the
cigarette lighter of my car (while the car is running).

Do I need to do anything to condition the 13.8v before feeding it
into the DC input of the FT-530? Namely:

1) Do i need to filter the DC to prevent engine noise from coming
through?
2) Add some sort of Zener diodes or MOV's to prevent voltage
surges from wiping out my radio?

(I would rather not buy the $29.95 adapter which Yaesu makes if I can
provide equally good protection for the radio for much less.)

323. SMALL 2m HT wanted for my wife...

Newsgroup: rec.radio.amateur.equipment
Date: 1994-01-31 23:46:30 UTC
From: d3h554@bloch.pnl.gov
Message-ID: <D3H554.94Jan31154630@bloch.pnl.gov>
Source record: 228150

I've just convinced my wife that she needs a radio! Yippee! :-)

I have an Yaesu FT-530, but don't ever use the 440 here in this part of the world, so would like to buy a simple, _small_ 2m radio.

I've seen the Kenwood TH-28A, and like the size. Are there any other radios out that this small? I know that Yaesu just came out with a _real_ small one, but it can't output more than about 2.5 watts (I could be wrong--it's been a while since I read the ad).

Any ideas? Suggestions? Testimonials? :-)

Thanx,

Curtis

From: linley@netcom.com
Message-ID: <linleyCKJGKo.61u@netcom.com>
Source record: 228156

Well, I finally got my Tech license in the mail (10 weeks, 4 days): KE6EQZ
I'm still working on the code and hope to pick up the CSCE for Tech+
privs soon. What I'm looking for now are opinions (pro and cons) on a
2m/70cm HT dual-bander. Desired features include:

HT (I don't want to be bound to the house or the car)
Under $500 (This is my tax refund)
Small size (but will trade off for features)
Rugged (not necessarily indestructible, but at least not "fragile").
No intermod.
CTCSS en/decode.
DTMF en/decode.
Ability to run on AA cells. (not just packs)
Decent battery life.
Some base-station potential (ant jack, & more wattage output with ext. pwr sup)

What is not important:
Wide band Rx. (I have a scanner for this)
Out of band Tx capability.
Brand specific message sending/paging stuff.

As I'm new to amateur radio, I may have neglected important features, or be
asking for mutually exclusive features (dual-bander vs. no intermod). Is
it worth it to get separate 2m and 70cm HTs? Do 2m/1.25m or 1.25m/70cm
dual bander HTs exist? Is a 2m/1.25m/70cm tri-bander a pipe dream? Your
comments are appreciated.

I have a hard time believing this. I expect the filter to be a ceramic
or a crystal (less likely) type. These filters always have an insertion loss.

I would reccommend filtering of some kind.. or if you don't mind the brick sticking out of your dash... get the thing from yaesu...
My car wouldn't exactly allow that kind of protrusion so I just got the power cable and the whine was most annoying... it's worse on receive than transmit.. I had a 470 and had similar problems, but not as bad. I guess you sacrifice filtering for a nicer radio with more bells & whistles...

I still love my '530.

Good Luck and 73

I think the DR-1200 makes a dandy 2m rig for packet, 1200 or 9600. Several folks in my club have 'em (me too) as well as we're using a DR-1200 for the club mailbox station. Good radio!

Yes, the DR-1200T (note the T) does need a mod to do 9600-bps packet. Alinco also sells a DR-1200H (note the H -- I believe it's an H) that comes 9600-bps ready out of the box -- no mods needed. If you intend to do voice with the DR-1200T I've been told *NOT* to do the mod.

If you need the mod it's on the net along with most other mods. If you want, just send me a piece of email and I'll send you the mod file from my QSZ! CD-ROM. (BTW, a new version of the QRZ! disk came out about 3-weeks ago with a new Windows interface and more files and updated callsign database (Canada & US combined)).

Good luck on high speed packet! I'm working to get a high-speed TNC/modem real-soon-now myself.

333. Interfacing TS50S and SGC-230

Newsgroup: rec.radio.amateur.equipment
Date: 1994-02-01 18:16:35 UTC
From: rcrw90@email.mot.com
Message-ID: <rcrw90-010294111635@waters.corp.mot.com.corp.mot.com>
Source record: 228160

The TS50S seems to be a natural companion to the SGC230 antenna tuner.

The SGC is about the only thing that will tune just about anything as an antenna, the only problem is - can you interface the optional "tune" control and LED line from the SGC to the "Tune" switch and LED on the TS50?

Obviously you coud butcher the TS 50, but it would be nice to do it from the accessory plug. Anyone know how the Kenwood tuners are interfaced or what is required?

Thanks and 73

The chances are that your FT 5200 is not fatally dead. What may have happened is that the battery voltage has dropped below one of the thresholds and the internal micro-processor has locked up.

Try a full hard reset : Put a pin or similar thru' the RESET hole in the back of the control head. Refit the control head. Press MHz and DVS whilst switching on.

Good luck

Price tends to be $20-100 depending on features, rust, power, etc...
Generally the Motorola band plan is found in the third character of
the model number, for instance T34RTA3100 etc. The "T" indicates
trunk mount mobile, the 3 indicates the power level, the 4 indicates
the frequency band. The next three characters indicate the model type
(RTA is early Micor) and the final four digits indicate type of squelch,
number of channels, bandwidth, etc.

The power digit for Micors is typically 3=35w 4=60w 5=90w 6=110w I think.

The frequency digit is 2=30-50, 3=150-170, 4=450-512, 5=800-900 (again this
is from memory but will be close).
Good luck

I was sure I read that the Yaesu FT-11(?) could do 5Watts with a bigger battery (9.6V?)

Standard makes a small 2m HT also.

Buy the adapter from Yaesu. It provides the needed filtering and is very
nicely packaged. That $29 is a small drop in the bucket compared to the
price of the radio. Do you really want to experiment on your own circuits
in this case?

Look at the FT 416. It uses the same battery as your FT 530.
My son has one and really likes his. And we just ordered one for my wife
to replace her old u2AT (now need 3 different pl tones and two splits which
is possible but a pain with the u2, ((anyoffers?)) . There is a super sale
on the FT 416 . Output is 2.5 W @ 7.2 V ; 5W@ 12 V. Battery is 600 mA.

If you happen to have an empty battery pack around that you will never use,
there is a good circuit in the '89 ARRL HB, and maybe later, that will
regulate the source voltage down to about 9 or 10 volts, and do a good
job of smoothing out variations, using an inexpensive 1.5 amp regulator
chip. I made one for a different HT. ---- Phil Emerson, AA8JO

>comments are appreciated.

The idea of having 3 radios into one is neat but when one of them
goes wrong (and they do, go wrong...) you are short of three radios.

I feature I wouldn't be without is a backlit keypad. The built-in
scanner is very nice, as I saw recently in an emergency, when a
severe storm thew trees against power lines, and started a serious
fire (as well as leaving everybody in the dark)

My radio is the Alinco 580 Everything is great about it except the
intermod problem. Some people say that you can have the radio
modified by Alinco to improve the situation. A friend is in the
process of having this done and I will see if it is worthwhile. I
live out in the boondocks, 10 miles from a city of 50,000 and I
still have to keep turning down the volume when I walk outside with
friends because of the racket coming out of the rig. I think the

radio is being QRMed by satellites:-)

Source record: 228168

Hello, I am looking for a used 2 meter or 2m/440 mobil rig for use with packet and also a higher powered radio. My price range would be from about $200-$425. I also have for trade a Sony Air-8 scanner with 144-174MHz FM, 108-137MHz AM, 76-108MHz FM, and 150-2194KHz AM coverage in excellent condition. My current HT has out of band coverage, so I do not need this. Please leave a reply here if you are interested.
Thanks,
Daniel Cline

344. Filters for TS-440S???

Newsgroup: rec.radio.amateur.equipment

From: oh3mep@lehtori.cc.tut.fi
Message-ID: <2ins67$rfk@cc.tut.fi>
Source record: 228169

Hello!
Is there still any other filters available for Kenwoods than
knwds own? Some times ago there was some Fox Tango and some
other company which made better filters for reasonable price.
However I haven't seen any lately, and a friend of mine is
willing to buy some filters for his TS-440S. He is willing to
try abt. 400Hz filters on both 455KHz and 8.***Mhz, and I
promised to find out where to find ones.
For some time ago I made my own IC-735 much better with an extra
500Hz wide Yaesu Ft-1000 filter on 455KHz, and it sure beats
Icoms own ...

Any help appreciated!

Pete

345. Advice wanted on mobile rigs

Newsgroup: rec.radio.amateur.equipment
Date: 1994-02-02 10:40:53 UTC
From: dev@armory.com
Message-ID: <CKLF09.3nH@armory.com>
Source record: 228170

i've decided to spend some of the money that Uncle Sam has been holding for me, and one of the things i want to get is a mobile dual-bander (2m/440) for the car.

i'm interested in finding out what people have and why they like or dislike it. what features are nice/annoying, ease of use, accessories available (back-lit DTFM mic for example), TX/RX ranges (some radios will only do TX from 440-450, while others will do 430-450), etc.

i'd also like to know of ways to mount the radio in the car such that it's less likely to get stolen. i'd really hate to find it missing one day, ya know. i see that at least a few companies have gone to so-called stealth technology by mounting the radio in the trunk, giving you just a display and a mic (in the case of Standard, the mic is the display, and the controls). how to mount this, and hide it when need be, remains a bit of a mystery to me still.

any advice would be cool to get. thanks.

Actually, the wide Kiwa filter is just a Murata cermaic filter, and so has
about the same insertion loss as the original Sony filter.

The narrow Kiwa filter is actually a filter module, containing at least one
filter and two buffer amps - one on the input, and one on the output.

I'll second the motion. The HTX-202 is also more sensitive on receive
than my ICOM-27H, of a late 70's or early 80's vintage. And the price
is right when Radio Shack runs one of their periodic "sales".

: : : Jerry, I myself have used both and found the DJ-162 all around better in
: : : its operations as well as its structure. The HTX-202 has no Mod info and
: : : is virtually an unknown radio internally. Maybe time will change that, but
: : : meantime technology moves on.

: : So you're saying that you *LIKE* intermod?

: : :-)

: Rich, the problem is that todays HAM is a buyer not a builder. Thae
: closest thing to this now days is a loose radio and a reliable set of
: mods. Is this truly HAM radio, that is the true question.

Well, personally, I don't considering building to be a necessary
part of amateur radio, even though I enjoy it a great deal. Heck,
whatever it takes to enjoy the hobby, even if it's just walking
into a store and pointing to a rig, is just fine. However, I'm just
astounded at the way that people will purchase low-performance
equipment at a high price, just because they think that a clock, 99
memories, and the ability to listen to the local airport are
reasonable items to add to a HT. I mean, come on, what's the point of
all the toys when you can't use any of them whenever you come in the
range of a paging tower? Meanwhile, those of us with the inexpensive,
less glamourous rigs will still be happily chatting or packeting
away without a care in the world. :-)

360. Through-the-glass antennas

Newsgroup: rec.radio.amateur.equipment
Date: 1994-02-03 13:13:56 UTC
From: drumhell@claudette.nrl.navy.mil
Message-ID: <CKnGr9.AMs@ra.nrl.navy.mil>
Source record: 228188

This past year I bought a new car, a 1993 Saturn. I want to install a 2-meter through-the-glass antenna on the rear window. However, I noticed that the top of the window is tinted opaque black. Question: is this tinting metallic or otherwise conductive? If it is, then I guess a though-the-glass antenna is out of the question. Anybody know anything about this?

> Milt
> KB7MSF

Another thing to keep in mind. A nastiness that the FT-2400 likes to do is
this:

I used to keep my FT-2400 on a slide mount witout attaching any of the
wires. I used the Yaesu supplied connector. If by some change I pulled the
radio out without shutting it off first, it would promptly blow away all of
it's memory information. Why? Because the radio is stupid enough to think
the ram backup battery is enough to run on. It runs for a total of 3
seconds (I timed it once.). When is Yaesu going to brighten up and fix this
problem??

3 = 45W, actually.

>The frequency digit is 2=30-50, 3=150-170, 4=450-512, 5=800-900 (again this
>is from memory but will be close).

Keep in mind, the radios don't tune the entire range suggested by the
digit in the model number. Each band comes in "splits"; people will
talk about a "High-band low-split" radio, or a "Low-band mid-split"
radio, etc.

The only way to determine which split a radio is on is to inspect the
boards in the radio. Each board is marked with a part number, like
TLE8027B, which indicates which split the board is for. The way to
find out is to look in the Micor service manual. Often, a board from
one split will tune much of the way into the adjacent split(s), but I
usually avoid doing this myself.

The boards to look at are the receiver (the helical resonators only
tune so far), the exciter (the multiplier coils only tune so far),
and the power amplifier. The exciter actually can be moved from one
split to another by changing a handful of silver-mica caps, but the
receiver and PA are more restricted.

If you get to know the Micor board numbers, you can often barter
with a seller like "Wait, that's a mid-split radio, that may
not tune down far enough", and agree on a lower price/return policy
if there's a risk the radio won't work for you.

I've tuned mid-split High-band (150Mhz..162MHz) radios down to 145Mhz with good results. Just use common sense; if the radio won't peak or remain stable when you tune it out of range, don't use it until you address those problems.

For amateur use, if you can find a Micor with the Motorola pre-amp, you're pretty well off. If not, a Hamtronics GaAsFET amplifier can be added and make the radio hotter than most current imports. Just keep in mind adding the pre-amp will make the radio a little more prone to intermod, but it will still be better than the average wide-band radio. Without a pre-amp, the Micor is very hard to crunch, like on a mountain top congested radio site.

Concerning the HTX-202:
: The radio is also free of intermod. I hear a lot of complaints on the
: air about intermod, but I never hear these from HTX202 owners.

: On the other hand you hear complaints here about the inability to
: expand the receive capabilities of the HTX-202 so one can monitor the
: NOAA weather or public service agencies. It is because you can't that
: the receiver is so clean. If expanded VHF reception is important to
: you, the Alinco would be the correct choice (of the two mentioned
: here).

That pretty much sums it up. What you have here is a clear tradeoff
of two things that may be desirable. Some people value the extended
coverage receive, some people can't live with the degraded receiver
performance. Take your pick.

366. Intermodulation

Newsgroup: rec.radio.amateur.equipment
Date: 1994-02-05 21:59:01 UTC
From: hoagy@illuminati.io.com
Message-ID: <2j14r5$n7m@illuminati.io.com>
Source record: 228101

A while back, I asked on a local board about intermodulation. I was
given an explanation, but as much as I hate to admit it, I don't grasp it.

I understand that if you have a radio that does more than t should,
such as out-of-band scanning, or dual-band HT's, you get "intermod".
Unfortunately, I don't know WHAT intermod signals sound like, what
they do, how they do it, and why I'm too moronic to grasp the concept.

Here's the situation that prompted the debate with myself:

I have a scanner which picks up the local mall security on 464.575
I also hear the WD8EEQ repeater on this frequency. The guy who
owns it hasn't been around for a few weeks, so I can't ask him why
I'm hearing his repeater out of the 70cm band, and why it's so
clear. I don't mean some static - this is as clear as day.
I'm also hearing Mall Security on that frequency. They do not seem
to be interfereing with each other.

Last night, when I went to the mall, I saw a dipole antenna above the security
office. Of course, until I got into ham radio, I never noticed it 'fore.
But it's definately a dipole. Lord knows it could be any sort of
dipole, but it looks all-too-hammish.

So, now I've got an explanation that "intermod is causing this".
I'm also at a loss to figure out security/ham on the same frequency.
And, btw, I'm listening on a scanner, not an HT. So, I do not
believe "intermod" is causing this.

Source record: 228096

There are a couple of types of interference that people call "intermod" but only one is intermodulation! The other two that I've seen called "intermod" are imaging and front-end overload.

Imaging is caused by the frequency-shifting performed in a receiver. Suppose the mall security is on 464.575, a ham repeater is on 443.175, and your receiver has an intermediate frequency (IF) of 10.7 MHz. When you try to receive mall security, the radio will mix the signal from the antenna with a 453.875 MHz local oscillator's signal, in order to generate the 10.7 MHz IF it needs for the later stages of reception. (Subtract 453.875 from 464.575 and you will get 10.7 MHz, assuming I made no arithmetic errors!) However, the mixer will recieve _any_ signal that is 10.7 MHz away from 453.875. That means it will receive 443.175 as well!

That is "imaging" -- two frequencies for the price of one. In a narrow-band receiver, a filter on the front end will remove the undesired signal. For example, a good ham-band radio will filter out 450 MHz on up, removing the mall security from contention. However, your scanner is inherently wide-band, so it can't filter as well. Lots of scanners have problems with images.

Front-end overload is simpler: If a signal is too strong, it may wind up overloading the receiver, making the mixing and filtering moot. The result is that you hear that too-strong station no matter what. You may see this on a car radio or a scanner when right next to a broadcast transmitter. In narrowband receivers, better front-end filters can help. Notch filters that remove the strong source can also help. While you may see front-end overload on your scanner, it is fairly unlikely that is what is happening here with the mall security and the ham repeater.

Finally, real intermodulation: This gets complex, but not too complex if you accept the existence of the 10.7 MHz IF in the radio. Suppose there are _two_ strong transmitters in the area, 10.7 MHz apart. If both transmit at the same time, no matter what their frequency is, they may mix inside your receiver's mixer and generate the 10.7 MHz signal needed by the rest of the radio. Presto -- you hear both, but only when both are on at the same time. Intermod can also happen if the two sources are farther apart -- suppose they are 146.00 MHz apart and you tune your radio to 146.00 MHz. That mixing effect may again create a signal your receiver picks up. Just as with the last two types of interference, intermod can be reduced by better filtering in a narrow-band receiver.

When I've encountered intermodulation, I have heard both signals simultaneously. Since it happens only when both transmitters are active, it may come and go strangely. One radio and location I've used suffers from intermod between a university maintainance repeater and a pager system. The result? Intermittent squeals of pager tone overlaid with maintainance radio traffic.

See? It's not as complicated as it seems. It might be worth checking your scanner's specifications to find out its IF, because that will let you add and subtract it to see if you are seeing imaging, intermod, or front-end overload.

I looked up that repeater and confirmed my hunch -- the problem is imaging, not intermod. WD8EEQ/R is on 443.175, which is 21.4 MHz from the mall transmitter. That means the scanner's local oscillator is smack in the middle, 10.7 MHz below the mall and 10.7 MHz above the repeater. It can't tell the difference between the two and has no filters to differentiate them, so it receives both.

The only cure is to buy or build a filter that removes the repeater's signal. It's probably easier to accept the scanner's limitations.

>
>No I didn't, I said Half Wave Vertical, not dipole. You are the one who said
>there is no differance in gain weather it is fed in the middle or at the end.

That's right, because there *is* no difference in radiation pattern, and hence forward gain. The only effect of feedpoint placement is different impedances presented to the transmission line, a non-issue with proper matching networks.

The relevant power formulas for isotropic (theoretical) and actual 1/2 wave radiatiors are

Isotropic P=Pt/(4*pi*R^2)

halfwave P=1.64*Pt/(4*pi*R^2)

Pt is transmitted power in watts
R is the perpendicular distance from the radiator in meters.

There is *no* distinction as to feed point placement.

From _Reference Data for Radio Engineers_, 4th edition, pp 675-676.

>Let me state it again...for vertical antennas, a half wave vertical has more
>gain than a quarter wave vertical, a 5/8 wave has more gain still, a 3/4 wave
>has more yet, and so on...But how does the gain change if fed from the center
>or off center like a Zepp (don't I remember something about them having a gain
>of 1.66 over a dipole or something like that...probably wrong).

Feedpoint location is irrelevant for pattern calculations of halfwave radiators, that's strictly a matching issue. (In practice, different matching systems can impact antenna *system efficiency*, but that's a separate issue. The relevant formula for vertical radiator field strength at a given angle from the vertical is

E=((60*I)/(D*sin(2*pi*h/L))*
((cos((2*pi*h/L)*cos(phi)))-(cos(2*pi*h/L))/sin(phi))

Where E is field intensity in mV/m,
I is antenna base current in amperes
h is length of antenna in meters
L is wavelength in meters
D is distance from the antenna is kilometers,
Phi is the angle from the vertical of the radiation

If you run this equation for a family of antenna lengths, you'll find that maximum radiation perpendicular to the antenna (toward the horizon) occurs at an antenna length of 0.639 wavelengths. This was worked out in 1935 by Gihring and Brown, "General Considerations of Tower Antennas for Broadcast Use", Proceedings of the IRE, vol 23, pp.311-356, April, 1935.

>But, we have to remember for a vertical antenna at given frequency, as the length

>ground with the proper amound of rock salt, and do the rest to make as perfect of
>ground as possible (this is suppose to work for Yagi/Quad beams on towers too). Wish

>I had the place to do this...or is it 100 acres?

Well we broadcasters do, and the angle of maximum radiation does *not*
rise monotonically with increasing length. In fact, starting with a short
antenna, it *decreases* until a length of 0.636 wavelength is reached, and
then increases back toward the short antenna case as length increases further
until it reachs the *same* value at 0.75 wavelength as it had at 0.25
wavelength. Beyond 0.75 wavelength, the pattern breaks into minor lobes
and gain perpendicular to the antenna continues to decrease. A vertical
antenna 0.639 wavelengths in height has the *maximum* broadside gain of
any simple vertical.

Data from _Reference Data for Radio Engineers_, 4th edition, pp.672-673.

>>>It is not true that a 5/8 wave vertical is the highest gain vertical.

Yeah, well that's because you're comparing apples and oranges. In the
case of the endfire 3 el array, the horizontal pattern is a figure 8.
In the case of the colinear vertical array, the horizontal pattern is
omni-directional. Both have a compressed vertical pattern, though the
colinear is much more compressed (that's where it gets *all* it's gain).
Compressing the pattern in *two* planes naturally gives more gain than
only compressing it in one, but forms a *directional* vertical antenna
rather than an omni-directional antenna. Apples and oranges. (Note too
that the example colinear has *zero* spacing between elements. That's
the lowest possible gain stacking arrangement. See your Cushcraft 4-pole
numbers for vertical elements stacked with 1/2 wave spacing. Much higher
gain.)

>On page 2-23 of the same text...
> ' ...An infinitely thin 1/2 wavelength dipole has a theoretical gain of 2.14 db

>boom length. (I have a love/hate relationship with quads) Higher Q elements.

No. Gain and Q are not directly related. A quad loop has a lower Q
than a dipole element, that's one of it's features, greater bandwidth,
but a 2 el quad has more gain than a 2 el yagi, about the same as a
3 el yagi in fact. That's because a loop has a bigger capture area,
and antenna gain is related to capture area by the following formula

G=(4*pi*A)/L^2

Where G is gain,
A is aperture area,
L is wavelength.

> (page 107)
> (that is a 4 dipole stacked array with 6 db gain over a dipole...sounds like
> a bit of difference from the ARRL Handbook figures...4.2 db, so much
> for homework)

Apples and oranges again. The 4-pole is a 1/2 wave spaced stacked array of halfwave dipole elements while the colinear you chose from the Handbook has *zero* spacing. Halfwave spacing gives a *much* sharper lobe, hence greater gain, than a zero spaced array. What they mean by offset and omni in the 4-pole spec is that the elements can be arranged all on one side of the mast (offset) for 9 dbd gain *in that horizontal direction*, or they can be staggered 90 degrees apart as they go up the pole for 6 dbd *omni* horizontal gain. Actually, this is a crummy antenna, and Cushcraft is always optimistic in their gain figures. A Comet stacked antenna is a better comparison.

Advertised antenna gain figures are generally measured by the marketing department, not the engineering department. That's why QST refuses to print them.

I'm about to send my DJ-580 in (again) to have the "intermod"
repaired. My transceiver would be quite satisfactory if I didn't have
the "intermod" problem with the UHF receiver. My VHF receiver seems ok.
ALINCO changed R419 and R472 the last time it was in for service but
that didn't seem to help the "intermod" problem.

I would be interested to hear from other DJ-580 owners about
their "intermod" experience. Has your DJ-580 been repaired?

A while back I picked up a Wilson WR-500 rotor at a hamfest. Does anybody have a wiring diagram for it? It has an eight pin socket (like a tube base) on the back of the control box and an eight pin jack on the rotor itself. It probably wires straight through but would like to know for sure before I cross my fingers and try it (I've wired too many U-100's from memory). Thanks for any help.

Transient Electromagnetic Pulse Emanation Standard (TEMPEST) is the US standard defining the amount of electromagnetic radiation that a device may emit without compromising the information it is processing.

In the US it not illegal to posess TEMPEST-surveillance equipment but it is illegal to take appropriate counter-measures to prevent surveillance. The US government has refused to release details of its TEMPEST research and has restricted the dissemination of independent research by classifying it.

The US Drug Enforcement Agency (DEA) makes use of TEMPEST secured electronics and computers as they believe that the drug cartels may possess surveillance equipment.

I am interested in gathering comments on the social, legal, ethical, and technical aspects of use of TEMPEST surveillance equipment in the US and Europe with the aim of including it in a discussion of the threats to computer/digital systems.

Please reply by E-mail. I will provide a summary to anybody who requests one.

thanks, - Rob Jackson

(more information on TEMPEST can be found in the paper "Eavesdropping On the Electromagnetic Emanations of Digital Equipment: The Laws of Canada, England, and the US" by Cristopher Seline - available on FTP from csrc.ncsl.nist.gov)

A friend of mine has just received his rig which he had modified, he thinks, after he sent it in because the radio had caught fire while being used in a car, powered by the cigarette lighter attachment.

It is too early to tell wether the intermod problem has been cured. In a few days we will be able to tell you more. I have the same type of rig and our complaint here is with the VHF part of it. We monitor mostly 147.12 mhz and even 15 miles outside a small city of 50,000 we often have to turn off the volume completely so as not to bother the folks around us. Today, with a few friends, I was walking through the woods, monitoring the local repeater 15-20 miles away, with the VHF part of the radio on (only) and I often heard all kinds of racket coming out of the radio.

To be honest, we were walking around a beaver pond, so this might explain the problem:-) Or could it be QRM coming from a satellite?

My friend had the parts you mentioned replaced, and also Q4161. The latter may have had something to do with the "fire" which melted part of the radio and the battery case.

I can't always tell who said what but whoever said a dipole has a gain of 2.14db over isotropic has to remember that that is in free space. A half-wave horizontal dipole over ground has somewhere around 7dbi gain depending on the ground. A half-wave horizontal dipole at a reasonable height has more gain than a quarter-wave vertical. A half-wave vertical has more gain than a quarter-wave vertical.

In no way does that equate to it being illegal to attempt to
suppress spurious electromagnetic radiation from computing devices. The
FCC even has rules requiring EMI/RFI filtering & suppression for
civillian & commercial computers & peripherals, albeit not in the name
of national security.

>The US Drug Enforcement Agency (DEA) makes use of

Yes & no. Some DEA processing machines contain or are capable of
accessing classified information. That alone requires the machines and/or
their containing room to meet certain TEMPEST criteria. The classified
info is what necessitates TEMPEST, and not specifically the belief that
narcotic organizations are using Van Eck devices, etc.

I have a slightly used, 5 month old Yaesu 990 HF rig. It
contains all manuals (including the optional service manual),
the original box, and original stock accessories.

I have performed the factory modification for general
coverage transmit (easily reversable). The radio is in new condition.

Reason for sale: I find I need the operating features of the
Yaesu 1000 rig, so I need to upgrade.

Price: $1600 including U.P.S. ground shipping.

At the risk of being late in responding, may I offer some advice?

--- DRILL A HOLE
--- MOUNT AN NMO
--- ENJOY THE HOBBY

The through the glass will leave *lots* of RF in the vehicle cabin,
and do not work as well as a hole in the car.

That is really tough to contemplate, especially on a new car, but I
have drilled holes in my car, and it cost a ton more than my first
house!

The NMO mount is very effective, and will work flawlessly for a
cellular phone antenna, almost de rigeur these days... when ready to
sell, antenna holes do NOT diminish the value, and cellular-ready does
help!

Go for it... but take it down to the mall and let a few people wham
their doors into your car so you won't feel like you are drilling a
virgin! ;^)

382. Kenwood TR-7800 memory backup?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-02-08 12:16:54 UTC
From: MSUORANTA@FINABO.ABO.FI
Message-ID: <1994Feb8.121654.5002@abo.fi>
Source record: 228110

I have recently brought an old Kenwood TR-7800
2m FM-rig. I use it mainly for mobile, and have
+12V DC connected from the car battery. I think
this +12V is used for memory backup as well.

Sometimes rig needs to be disconnected, though, as
I would rather not leave the rig in a parked car
overnight. There are four NiCd cells for memory
backup, but current drain is so high batteries run
out in a matter of days.

NiCd's get charged when rig is connected to power
supply and turned on. But I do not need my rig every
day and would rather not have a big 12V/20A power supply
on just to have +12 on power conenctors to keep memory and
charge those NiCd's.

There is small 3-pole male connector in the back of the rig
labeled "backup". This is intented for a small power supply,
just a few mA to keep memory. Such power supply is no longer
available and I have no documentation about connectors. I
was thinking of a small supply, if I would only know what
voltage & polarity the pins are... Maybe the connector also
needs to be changed because I haven't found female connector.
(like microphones, have you ever seen same kind of connector
in two different rigs..).

Any advice will be appreciated. Please post or e-mail.

383. TS140S + ARRL Powersupply...

Newsgroup: rec.radio.amateur.equipment
Date: 1994-02-08 13:10:32 UTC
From: demetre@phaethon.intranet.gr
Message-ID: <2j8308$9m7@helios.intranet.gr>
Source record: 228111

CQ Netters...

A friend just constructed the powersupply described in the
ARRL Handbook page 27-3 in the 1994 book (the page changes
depending on the handbook publishing year)
A few modifications were made in order for the supply to be
25 Ampere able (by using a different power transistor
and a larger transformer).
The supply worked fine, it only dropped it's voltage by
0.1 volts at 25 A. and all seemed fine untill we noticed
something really strange...
While having a TS140S hooked on the power supply, and while
the radio itself was off, when the supply was turned off
the voltage would jump to full voltage (30V+) for a second
or two before the capacitors would discharge...
While trying to simulate the affect with a 25A load (several
automotive lamps) the supply did nothing out of the ordinary
and no such "spike" was detected!
Has anyone seen anything like the above mentioned effect ?

I talked to MFJ recently .. the rig is suppose to be off the production line about this week.. or maybe next.. this is from one of the VPs and he has been very honest with me in the past. I am anxious to test this one out.. make a great portable/mobile rig, especially with CW module. It wasn't clear from the add whether you can leave the CW module in and switch back and forth or have to have the module out for SSB and in for CW.

In article <CKvGDJ.GFv@srgenprp.sr.hp.com> alanb@sr.hp.com (Alan Bloom) writes:
>If you compare a vertical over an infinite ground plane to a dipole
>(or any other antenna) in free space, you are comparing apples to oranges.

True.

>When thinking about antenna gain, it helps immensely to remember the
>principle of conservation of energy. Nearly all full-sized antennas are
>essentially 100% efficent. That means that a dipole, a vertical, a
>rhombic, a Yagi beam, etc. all radiate 1 watt for every watt applied
>through the feedline. To obtain gain, the antenna directs more of its
>signal in one direction and less in another.

I'd argue that a quarterwave vertical over real lossy ground doesn't
fit the idea of 100% efficiency very well. It expends quite a bit of
it's energy warming the earthworms in the lossy soil making up it's
current mirror. (IE half the "full size" antenna in this case is really
a current reflection in the lossy ground.)

>Any antenna over an infinite ground plane has a 3 dB (2x power) advantage
^^^ emphasis added
>over an antenna in free space. That's because it only has 1/2 of all
>possible directions in which to send its signal.

Over an infinite *perfectly reflective* ground plane. Over lossy ground,
that 3 db is reduced by ground losses, though some gain remains. The
more you can improve the ground plane, the closer to the ideal 3 db
you'll approach.

>Consider a vertical dipole in free space. You could insert a horizontal
>infinite ground plane at the feedpoint without changing the radiation
>pattern. Now you have two verticals, one pointing up, one pointing down.
>Each vertical radiates half the power of the original dipole.

True because each has half the current that flows in the entire dipole.

>Note
>that the upper vertical (over a groundplane) can generate the same
>field strength as the dipole (in free space), but with only 1/2 the power.

No, I disagree with the way you're saying this. The upper vertical in
this thought experiment has half the current of the dipole and so generates
half the field. The ground mirror is supplying a 3 db reflection gain that
makes up for the lower field produced by the current in the upper vertical.

>So a 1/4-wave vertical over an infinite ground plane has 3 dB power "gain"
>over a dipole in free space.

True only *if* it has the same current flowing in it as the dipole. IE
the current flowing in the quarterwave vertical is 2 times the current
flowing in *half* of the free space dipole. (True for constant power input
to both antennas since the base impedance of the vertical is half that of
the dipole.) That, with the phantom mirror current in the ground plane,
has the same effect as would doubling the current fed into a dipole in free
space, thus the 3 db gain.

I think we're trying to say the same thing, but looking at it from a
slightly different perspective.

>Now consider a dipole suspended a half wavelength or more over an infinite
>ground plane. In some directions, it will have 6 dB gain over a dipole
>in free space, which gives 3 dB gain over the vertical. In other directions,
>the field will be zero. If you averaged the radiated power over all
>directions (half sphere), you would find it sums to the same power as the
>1/4-wave vertical (also averaged over all directions.)

True, but gain in the main lobe (what we normally mean when we talk about
gain) is 2X that of the vertical. And in the real world of lossy ground
planes that make poor current mirrors, the horizontal dipole has a greater
efficiency. A vertical halfwave, that doesn't need the current mirror,
will also have greater efficiency than the quarterwave over real ground.

The U. of MN ARC provides communication for the EMTs at Gopher Basketball games, and (surprise!) the games can get quite noisy. I currently use an earplug with a speaker mike, and I am looking for a better solution. When I am standing near the band, I can barely hear through the earpiece, and cannot hear myself as I speak through the mike.

Would an ear mike help? Any experiences??

389. Kenwood TS-140 "Crummy" Switches

Newsgroup: rec.radio.amateur.equipment
Date: 1994-02-08 17:48:09 UTC
From: c2xjcb@kocrsv01.delcoelect.com
Message-ID: <1994Feb8.174809.29247@kocrsv01.delcoelect.com>
Source record: 228116

Please respond directly via E-mail . . . I don't regularly subscribe
to this newsgroup . . .thanx

I have a Kenwood TS-140 that's about 3 years old, and I've noticed
that several of the "buttons" (and the small rotary knob used for
10KHz steps and memory channel selection) don't seem to work very
well anymore. The rotary knob was the 1st to go; rotating the knob
at a reasonably brisk pace wouldn't hardly "move" your frequency at
all (in fact, sometimes you'd find yourself a few 10's of KHz in the
OTHER direction from what you'd turned it). Apparantly there is some
sort of "switch bounce" problem. Kenwood DID leave a small hole
behind the knob for spraying-in "Tuner Cleaner", which works for a
while, but the problem comes back after a few weeks.

Lately I've noticed that several of the push-buttons (the ones to the
left of the main tuning knob, used for LSB/USB CW/CWN AM/FM and for
the VFO->M selection, no longer work well. You have to press them
off-center to activate, and the VFO->M button is nearly DEAD.

I am not a MAJORLY active ham, in fact, I'm embarrassed at how little
I use my hard earned license (always seems to be other things I need
or want to do around the house) . . . so I don't believe that the
problem stems from over-use (i.e. wearout). Can my "lack of use" be
a problem (i.e. oxidized contacts)? The rig IS in my basement, but,
it is heated and dehumidified, so moisture doesn't seem likely.

Anyone have any similar experiences? Any good remedies?

Thanx (in advance).

I'm looking to purchase a new stereo and I was wondering if you might provide some insight and advice. Any help would be greatly appreciated!

I would like a stereo with excellent sound quality for classical and rock music. I would like 2 tape drives and a 1+ CD platter for continuous play. Friends have tried to encourage me towards getting surround sound, but that raises the price even more.

What are some good name brands? Where are the best stores to shop for whole systems and components? Is surround sound worth it?

Thank you in advance,

Jean Henchey

: >Each vertical radiates half the power of the original dipole.

: True because each has half the current that flows in the entire dipole.

No, the current is the same, but the power is halved. There are (at least)
two ways to see this: 1) Only 1/2 the voltage is applied to each 1/4-wave
element. Since power = voltage times current, the power is 1/2.
2) The element is only 1/2 as long. So the same current results in
only 1/2 as much power radiated.

Actually, 2) can be derived from 1). (Left as an exercise for the reader :=)

: >Note
: >that the upper vertical (over a groundplane) can generate the same
: >field strength as the dipole (in free space), but with only 1/2 the power.

: No, I disagree with the way you're saying this. The upper vertical in
: this thought experiment has half the current of the dipole and so generates
: half the field. The ground mirror is supplying a 3 db reflection gain that
: makes up for the lower field produced by the current in the upper vertical.

Nope, see above.

: >Now consider a dipole suspended a half wavelength or more over an infinite
: >ground plane. In some directions, it will have 6 dB gain over a dipole
: >in free space, which gives 3 dB gain over the vertical. In other directions,
: >the field will be zero. If you averaged the radiated power over all
: >directions (half sphere), you would find it sums to the same power as the
: >1/4-wave vertical (also averaged over all directions.)

: True, but gain in the main lobe (what we normally mean when we talk about
: gain) is 2X that of the vertical. And in the real world of lossy ground
: planes that make poor current mirrors, the horizontal dipole has a greater
: efficiency.

But to get the 6 dB gain, the dipole depends on ground reflections, just
as the vertical does. It gets very complex trying to compare ground losses
of ground-mounted verticals versus horizontal dipoles because of the many
variables involved (type of earth, number of radials, height above ground,
vertical radiation angle, etc. etc.). That's why assuming a perfect ground
gives a much more usable standard of comparison.

398. Opinions wanted on mobile dual-banders

Newsgroup: rec.radio.amateur.equipment
Date: 1994-02-09 09:47:19 UTC
From: dev@armory.com
Message-ID: <CKyB6w.4Fp@armory.com>
Source record: 228126
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

i posted this a little while ago just to the equipmet group, but
seeing as i got little response, i'm widening my audience a bit. :-)

anyways, i'm looking to get a mobile dual-bander for my car. and of
course i'm interested in finding out what other people have and
why the like or dis-like it. i'm interested in what sort of
features they have, what features they do or don't need on it,
what's really good to have (expanded recieve? backlit DTMF mic?).
tell me your experiences, etc.

i've noticed that most of the units only do tx from 440 to 450
in the 70cm band. that seems a little weird to me. only the
Yaseu seems to do 430 to 450. these sorts of oddities is what
is confusing me as to what to buy.

any help on this would be really appreciated.

I can tell you all this much about 1/4 wave aerials. They usually have less gain than 1/2 dipole, because of ground imperfections. However if your aerial uses your transmission line, then this may appear the other way around. 1/4 wave ground plane aerials are 1/2 wave dipoles if you have a perfectly conducting infinte ground.

Ok, apparently I'm not analyzing this case properly. Here's the way
I see it.

Dipole split by infinite ground plane.

```
|
|
-------/\/\/\/\---o | o---/\/\/\/\-------
E1 | E2
|
|
```

If we apply drive to E1-E2, equal currents are driven into each element's
impedance. So the halves of the dipole have equal currents flowing in them,
but 180 degrees out of phase. With the infinite ground plane isolating the
halves, one half has half the total current flow.

: impedance. So the halves of the dipole have equal currents flowing in them,
: but 180 degrees out of phase. With the infinite ground plane isolating the
: halves, one half has half the total current flow.

Let's call the voltage applied between E1 and E2 "V". Since there are
equal and opposite voltages on the two terminals, the voltage applied
to each is V/2.

If, for example, V = 73 volts, the current in the dipole is 1 A (since
the radiation resistance is 73 ohms.) With the ground plane, the
impedance of each 1/4-wave element is 73/2 = 36.5 ohms. Since you have
half the voltage (37.5 V) applied to each half, the current is still 1A
in each 1/4-wave element.

The resulting field is the same for the ground-plane case as for the
dipole in free space. It is as if the other half of the dipole were

still present. That's where the concept of the "image" antenna extending below the ground plane comes from.

I have a neat dual band radio, and a neat Apple Newton, and my thoughts go as follows: If I can run packet off my calculator (HP48SX) with a normal TNC, I should be able to find something for the Newton! Has anyone tried this? Are there any products around that can run out of the Appletalk or PCMCIA ports that are either TNCs or will allow me to use an existing TNC with Newton? I'm not sure if I could use a TNC out of the Newton appletalk (serial) port with just a cable adaptor, and even then terminal software might be a pain. If any Macintosh users have packet experience, that may be of help, too. Any advice/references/opinions/prices would be greatly appreciated.

Does anyone have comparison data for the Kenwood TH77E and the Standard 720
dual band handhelds ???
Which is better ? why ? can either of them turn their TX off automaticly
while being used as repeaters ??
Which has more repeater related functions ??

****

Posting for my brother who doesn't have an account...

I have a cushcraft R7 vertical antenna I want to trade for
a good working HF solid state transceiver; I can make up
some cash with the antenna if necesary.

I can be reached at (408) 279-6028 evenings and weekends.

Luis Estrella
KD6VTZ TRADE ONLY

****
Or you can send me e-mail and I will give Luis your message.

: keyer?

If I'm not mistaken, the LogiKey is the commercial version of the CMOS Super Keyer II which was first described in the November 1990 issue of QST. That keyer is available in Kit Form (i.e. parts, pcb, but no switches, boxes, or batteries) from:

Idiom Press
Box 583
Deerfield, IL 60015

When I bought mine (it is a WONDERFUL keyer), I paid $45 + $3 for domestic USA shipping. Foreign orders were $45 + $5.

Sorry, that's all the info I have.

>lighter plug. What type of fuse is recommended for this, and is there
>any other circuitry that is advisable to connect between the radio and
>the car?
>...

Larry, I also used a DJ580 for a long time as my only ham rig. It was
in the mobile most of the time. Most likely, from my experience, you
will get lots of engine noise through the cig lighter.

I recommend that you buy some 14 gauge wire and wire your plug straight
to your car battery, + and -. Fuse it with no less than a 3A fuse.

For more power, I used a Ramsey kit amplifier for 2M -- 5 in 30 out.
This may cost you between $60 and $100.

Good Luck! --Ray Stein

417. Kenwood TH-22AT Mod

Newsgroup: rec.radio.amateur.equipment
Date: 1994-02-10 20:46:29 UTC
From: forsberg@rainbow.dfw.or.gov
Message-ID: <2je6f6$55@pith.uoregon.edu>
Source record: 228145

==========

Subject: TH-22AT Beyond MARS Modification Date: November 17, 1993

This modification is provided "as is," and is subject to change without notice. Kenwood Service Corporation makes no warranty of any kind with regard to this modification procedure, including, but not limited to, the implied warranties of merchantability and fitness for a particular purpose. Kenwood Service Corporation shall not be liable for any error or for incidental or consequentialdamage in connection with the furnishing, performance, or use of this modification procedure.

This procedure will expand the transmit capabilities from 136.000 MHz to 173.995 MHz.

PROCEDURE:

1. Turn off the power.
2. Remove the battery pack.
3. Remove the two long screws from the rear of the radio case.
4. Remove the two knobs from the top of the unit.
5. Remove the rubber top panel.
6. Squeeze the bottom of the front panel together and gently separate the two case halfs. Use caution so that you do not damage the thin ribbon cable connecting the front panel to the main unit.
7. Remove diode D208. Located on the circuit board behind the front panel. See diagram.
8. Place the diode you just removed [D208] in the location shown for (D212) and solder in place. Observe proper polarity. The diode should face the same direction as diode D210 and D211.
9. Reverse steps 1 - 6 to reassemble.
10. Reset the microprocessor.

CAUTION: This modification requires soldering equipment rated for CMOS type circuits. It also requires familiarity with surface mount soldering techniques.If you do not have the proper equipment or knowledge do not attempt this modification yourself. Seek qualified assistance.

Time required for this modification is 30 minutes or less.

418. Help: Power Folding Back of TH215A

Newsgroup: rec.radio.amateur.equipment
Date: 1994-02-10 21:39:31 UTC
From: hpaik@silver.sdsmt.edu
Message-ID: <hpaik.32.2D5AA993@silver.sdsmt.edu>
Source record: 228046

I have a Kenwood 2m HT TH215A.
When I start the transmission, puts out 2.5W(?).
Then the power drops to the 200mW(?) right after the first
transmission.
It has been like this since I got the new one.
I thought the repeater did not have a good sensitity.
I bought Yeasu FT530 a few month ago, I never had a problem
like that. Then I started to have a suspicion of th215a.
I measured the output power, it has the power folding back.
I changed the antenna, but still samething happened.
Any help/similar experience of this kind would be
appreciated.
Thanks,
H.W. Paik at hpaik@silver.sdsmt.edu

419. Buying record jackets and sleeves bulk

Newsgroup: rec.radio.amateur.equipment
Date: 1994-02-10 21:45:54 UTC
From: qchorn@mtu.edu
Message-ID: <2je9ui$68a@mylab9.my>
Source record: 228047

I just started working at a radio station that has neglected their vinyl records since they started using CD's. After four years, the condition of their collection is very bad. About one out of ten need new jackets and sleeves. That means we need probably a minimum of 750 generic jackets and sleeves. Does anyone out there know where we could buy these in bulk. Most of the people at the station don't consider the records as an important source of music and therefore probably won't allocate much money for supplies so the cheaper the better.

I'm not looking for "audiophile" type stuff here. We don't need antistatic

jackets and rice paper sleeves. The cheap, generic stuff will do just fine.

I would appreciate it if you would e-mail me any responses as I don't normally read this newsgroup.

Thanks for all your help,

>half the voltage (37.5 V) applied to each half, the current is still 1A
>in each 1/4-wave element.
```

Yes, yes, I understand that, but look at what you're saying, "the current is *still* 1A in *each* 1/4-wave element." Since the dipole has *two* elements, 1+1=2, it's instant flow is twice the current of a single element. (I understand what phase does to *net* current at the *feedpoint*, but that's really a different issue. When the barrier of the infinite ground plane comes into play, it *isolates* the two branches so we can treat them separately. Hence we can see the individual 1 ampere flows at the feedpoints of the two halves without phase combinations.)

Let's examine *why* an antenna radiates for a moment to see what I'm getting at here. Radiation occurs when an electric charge is accelerated. The relevant factors are the amount of electric charge, RF current, the accelerating potential, RF voltage differential over the charge path, and frequency, the rate of change of voltage along a current path. These three are all intimately related, but in most antennas, the instanteous current is a key to predicting radiation field shape, and hence gain. The 1/4-wave monopole in the example has half the instant current of the dipole, and half the total end to end electrical potential. So crudely it would seem to have 1/4th the field strength, but it's length is 1/2 as great (frequency effect) so the accelerating gradient is the same. That leaves the *signs* of the current flows that make the field of a free space dipole. These vector sum to the same field strength as the monopole over an infinite ground plane. The dipole's currents generate fields which vector sum in a way that makes 1+1 appear to equal 1. The ground plane should be seen as a *shield* to prevent this summing, not as a mirror.

>The resulting field is the same for the ground-plane case as for the
>dipole in free space. It is as if the other half of the dipole were
>still present. That's where the concept of the "image" antenna
>extending below the ground plane comes from.

Uh huh, but an "image" antenna extending below the ground plane is not reality. It's a visualization trick that's sometimes useful, but the currents that actually flow are induced currents flowing along the surface of the conducting plane. They are *not* the same as the currents that would flow in an "image" antenna. They are the currents a *field* generated by the image antenna would induce in a perfect conductive sheet. This is important to understanding the effects of *real* ground planes which are neither perfectly conducting, nor infinite in extent. And is the reason *real* 1/4-wave monopoles over *real* ground planes have less gain than vertical dipoles, or 1/2-wave vertical monopoles.

Gary

If you installed RF ammeters in each element, they would read the same no matter whether the ground plane is present or no. (Since the RF generator and both elements are in series, the current must be the same in each.) Each 1/4-wave element radiates 1/2 the total power no matter whether the ground plane is present or no.

Ok, while looking the other day, I came across a mod for the Kenwood 742.
I know of the Mars/Cap deal, move the chip resistor from 1 to 8 and reset.
These looked kinda neat, I did manage to get 870 out of some of it, but It
NEVER SAID WHAT THE MOD WAS! The opening statement said they guy was not
good in English, and it showed. It was from some JY1 or something. If any-
one knows what the deal with that is, tell me.. Im kinda curious.

It is an iambic keyer. Fairly full featured.

>Is it worth it?

I don't know since I have never used any others. I was attracted to
this keyer because it is available in kit form. I didn't want to
simply buy it.

The article describing the keyer is in QST and in recent issues
of the ARRL handbook. It describes an earlier version of the
software. The new version adds emulation of Accukeyer and Curtis "A"
etc. Memory dot and dash is now configurable. There are several
other enhancements as well.

The online manual is available for free from Idiom Press with
a formatted diskette and mailer. I know. I got it when I
bought the kit and converted it to Latex.

I've recently gotten an R-4B and am quite pleased with its performance I'd like to extend coverage, however, and don't want to go broke on crystals. I'm planing to build a substitution box which would be essentially a coarse frequency synthesizer. Since the range is broad, I'm planning to start at 50-80 Mhz and heterodyne down to the necessary frequencies for the preinjection mixing. I'm interested in any references as to the injection level for the crystal port. Since it's coupled to the grid of the HS6 premixer I'd guess that necessary drive levels would be low. Any hints or references on the subject would be welcome. Thanks.

433. DX Desktop

I am considering getting DX Desktop 2.0. It is a windows-based hardware and software package that integrates a TNC and radio to a database. I saw a demo a couple of months ago. The thing I like about it the most is that it requires only one comm port by using a plug-in card that connects to the TNC, radio, and rotor. The thing I dislike about it the most is the price, $289!

Has anyone used this package? How stable is Debco Electronics? Are they going to be here next year?

I am currently using DXBase. Has anyone imported DXBase into it?

Any comments would be greatly appreciated.

Thanks and 73,

Mike, WA5CMI

Drake used to make a box that did just what you want. As I recall, it
was made to be used with the SPR-4 receiver, but perhaps it would be
close enough to give you some ideas. I bet if you called Drake,
someone there would remember the model number and could send you
a photocopy of the manual for a nominal fee.

435. TH78A any good?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-02-11 22:34:11 UTC
From: asmsr@acad2.alaska.edu
Message-ID: <1994Feb11.183411.1@acad2.alaska.edu>
Source record: 228062

I was just curious.. is the Kenwood TH78A HT any good? I've been looking through a number of magazines and catalogues and so far, it's the best I can find. Do any of you have any experience with this transceiver (140/440, 5w)?

Is there anything any of you are partial to? I'm looking for a dual-band unit with DTMF and small size (like a handheld, or even a portable). I'd also like something that can be easily recharged and is able to plug into a wall socket so I don't need to run the batteries down. Have any of you used something that fits this description (and like it)?

Any help you could give would be great... E-Mail to this account, if you can. My name is David Nesting (this account is a friend's).

Thanks again...

>
> -thanks in advance es 73
> Ken

Don't worry, Ken. I can't believe that Yaesu hasn't figured it out yet,
but they forgot to drill a hole for the microphone to hear through. I had
the same problem. You can either take it back, have a person where you
bought it fix it, or fix it yourself.. here's how:

Take the screws out of the back of the mic. Split the two halves apart -
it's a little tricky.. there's a connector that links the 2 halves together.
Gently pull the microphone from its cylinder and look down the hole. What
do you know? No hole! So, take a small drill bit - 1/16" at the largest and
from the back drill a small hole so that it lines up with the end of one of
those nice grill-looking things on the front. Don't drill all the way through.
You should be able to get a hole without defacing the front. Do this by hand
NOT with a drill. It's very soft plastic and with a sharp bit it should be
very easy.

Good luck and 73

I was wondering if anyone knows if the DTMF codes that the new Yaesu FT-11R and FT-41R use to send alpha-numeric messages are the same ones that the Kenwood TH-78A uses. I went up to HRO on my lunch hour and took a close look at the new Yaesu radios and noticed the MSG key. I just am wondering if I get this radio will I be able to talk to my Kenwood buddy. Also - if anyone has any comments about this radio - I.E. running down to 3 volts I would appreciate your comments. Thanks

[Please excuse me if I posted this to an inappropriate news group.]

I am looking for a good receiver to integrate into my system. I want
a receiver that will have a good bandwidth SW PLUS AM & FM in one unit.
Unlike in Asia (and probably Europe), such units are hard to find here
in the USA. I have inquired at a number of stores and they don't carry them.

Any information regarding where I can find such units, approx. pricing,
alternatives (I am an absolute amateur putting together my sound system
for purely personal pleasure), obstacles to importing (if that's an option)
will help me greatly.

PL. E-MAIL ME. Many thanks in advance,

Gowri Narla

: keyer (saw one once) but it seems like it'll take relearning.
: Is it worth it? Comments anyone?

Yep - just about all the keyers made over the past decade or two have
been *capable* of iambic operation. However, if you have a non-iambic
keyer paddle - they will still work. I prefer non-iambic myself, having
started out on a bug many, many years ago. The Logikey/CMOS Super Keyer II
is wonderful in either iambic or non-iambic operation (I have used both).
Iambic DOES take relearning and involves much less wrist movement than
non-iambic single lever paddles and is probably the way to go IF you are
a newcomer to keyers. IF you learned on a bug and/or LIKE non-iambic
keying - why bother to change?

We're not arguing over *results*, we both agree on the patterns
so ELNEC wouldn't settle anything there. What we're discussing
is the most useful way to visualize what's happening in and around
the antenna from a "first principles" point of view. (At least I
am, I'm not sure Al is coming from the same direction.)

Shawn,

Well, you can try a few obvious places, Hamfests, Want-Ad's in QST and other ham-oriented magazines, or the Yellow Sheets. Frankly, here on the east coast, most hamfests have become either junkyards for misc commercial electronic junk, or computer swap meets where you have major computer dealers, and used computer dealers selling their wares along with software. Most hamfests don't have very much ham radio gear there any more, but it's useful to look, bring cash, and prepare to dicker a bit.

Regarding QST, CQ, 73, and World Radio magazines, usually the ad's placed are at least 3 months old (due to lead time for the magazine to be published). You may get lucky, but most people probrably would have sold the gear by the time it hits the streets within the magazine.

Yellow sheets....There are a few bi-weekly newspapers that are oriented to selling rigs. One of the best is the Yellow Sheets. Look in QST for a AD to get their address. They offer a mini 4 issue subscription pretty cheap, and you can find about anything from soup to nuts in there. Again, have cash ready and be prepared to call quickly since most popular items (and cheap ones) go quickly.

One last place, in QST there are a few places that advertise used gear, Assoicated Radio is one of them, get a idea of how much you have to spend, and give them a call, find out their guarentee, and shipping when you make the call, so you know beforehand. There are several besides Associated Radio, and this may run your phone bill up a bit since most places don't accept calls for used gear on their 800 lines, since it costs them for the call.

Good Luck,

Joe KI3B

444. HT Recs out there?

I am looking for recommendations for getting a HT. I'm still waiting for my ticket, and I've read that the HT isn't the best thing for a first rig but I'll explain. I'm a undergraduate in a dorm. I can't set up any real antenna. I have no car. However, once I have my license, I'll have access to the school shack. The amateur radio club is in the process of relocating their repeater to the dorm that is about 100m away from me--it's a 2m repeater. What should I get?

I've been looking primarily at dual-banders, especially the ICOM IC-W2A. Any complaints or complements for this or Kenwood's or Yaesu's or Alinco's? I also like the look of having a wide band receiver as the IC-2SRA, but as I already have a PRO-43, I know I don't need it. What are your recommendations? Go new? Go used (I think that there will be an ARRL convention in Dallas area this summer, is that right?)???

I'm kind of flexible on price range--I'm willing to spend a little more if I know I'll be using it for a LONG time.

Where is a good place to buy? Mail order? Tucker's Electronics (ads in _CQ_, etc) is close to my house in Dallas. Any suggestions about dual-band vs. just 2m or 70cm?

Any and all suggestions are appreciated. Thanks in advance.

>Comments anyone?

Worth every penny and more. Yesterday, I got the partial kit version,
called CMOS Super Keyer II and sold by Idiom Press. I did not go to
bed till 2am as I was fussing around with the kit and having a great time.
It - accepts commands by paddle, great for mobile operation (my use)
- store upto four messages, soft sectored into a 220 char space
- messages can contain commands to speed up/down, invoke other
messages or itself, user defined breaks for paddle inserted comments
- ultra low power consumption, down to 10ua withing 2 s of idleness
- deals with serial numbers, auto increment, repeat etc
- digital and linear analog speed setting
and much much more.

Here is a short intro to electronic keying. First off, there are many ways
of generating CW:
straight key - quaint but top speed is kinda limited for most ops
mechanical bugs - require training, I would love to master them but
haven't gotten around to it yet
electronic bugs - you make the dahs, it makes the dits. Single lever
paddles are ok. Needs paddles and keyer.
side-swiping - electronic dits/dahs, may have dit/dah memory. Dit/Dah
memory means that the dit/dah elements are self completing
Single lever paddles ok. Many ops use double lever paddles
to do this. Not needed. Electronic keyer needed to
generate the dots/dashes.
iambic - absolutely needs double independent levers in the
paddle. The electronic keyers come in a variety of
flavors. Curtis Mode B is the most common.
keyboard - use programs on pc, tncs or dedicated keyboards. Used
very commonly by super qrq ops, such as k5fo, and
contesters (keyer is often part of the logging program
such as CT, NA, N6TR's logger etc.

I use an iambic paddle and keyer built into my TS850 for most operating. When
contesting I use CT. I use the CMOS Super Keyer II (Kit version of Logikey)
in the car with my TS50/bugcatcher.

A few words about iambic paddle operation. One lever, commonly the left
one, is used to generate dits and the other generates dahs. If either
one of levers is held the effect is like using a side-swipe keyer:
continous series of dits or dahs. Most keyers have dot and/or dahs memory
and so touching the dah paddle followed by the dit paddle generates the
letter N. But this hasn't much to do the iambic capability yet. If
both the paddles are squeezed toghether then the keyer emits a continous
stream of alternating dits and dahs (short/long - iambic meter in poetry
and hence the name). This makes sending code much easier. For instance
to send the letter C, you just hold the paddles together starting with
the dah paddle. The point at which you let go depends on whether it
is a Mode A or Mode B paddle. With mode B you let go of both paddles
while emitting the dah. In mode A, an older mode that is favored by some ops,
you have to let go *after* completing the dah element.

This may sound complicated but is easily unserstood by playing with a keyer/
paddle combo for a while. Also check out (part of my handout to CW students):

1. The iambic gambit. By Lew Fay, AA5Q. QST (I forget the year/month)
2. Keys, Keyers and Keyboards. By Bruce Hale KB1MW QST Dec. 1989.

Hope this helps.

I have a Yaesu FT-470 dual-bander that I am quite happy with, and the model that replaced it (the FT-530 looks quite nice as well). I have also heard a lot of good things about the Alinco DJ-580, which looks like a wholely excellent radio for not an exorbitant amount of money. The Icoms, in my opinion, tend to be a little pricey.

> I'm kind of flexible on price range--I'm willing to spend a little more
> if I know I'll be using it for a LONG time.

The FT-530 and Alinco DJ-580T are both running in the $375-450 range. I'm not sure how much the FT-470 that I have is since it was a gift, but I think around $400.

> Where is a good place to buy? Mail order? Tucker's Electronics (ads in

I find Tucker's pricing to be a little expensive. I am partial to AES (in Milwaukee, among other place) myself, but if you shop around in the ads in CQ or something like that you may be able to do better than AES's prices.

> _CQ_, etc) is close to my house in Dallas. Any suggestions about
> dual-band vs. just 2m or 70cm?

If it were me, I'd get the dual-bander myself. No sense locking yourself out of all that fun stuff available on 440. I almost made that mistake, and then decided that to ask for a dual-bander would be a lot less painful than kicking myself later for not having one.

> Any and all suggestions are appreciated. Thanks in advance.

If you need any more info etc, please feel free to drop me email (cravitma@cps.msu.edu)

Congratulations on passing your test.

448. Experience with Ray-O-Vac "Renewal" batteries - disappointment

Newsgroup: rec.radio.amateur.equipment
Date: 1994-02-13 21:01:02 UTC
From: dgf@netcom.com
Message-ID: <dgfCL6L1t.Mx1@netcom.com>
Source record: 228076

I purchased four "D" cells and their recharger. My application requires 6VDC at about 5 amps continuous. When new, the cells decreased from 6V (series connected) output to about 4V output rather linearly during about 30 minutes of loading. I recharged the cells as directed, and repeated the usage. After only 15 charge/discharge cycles, the battery reached 4V output after only 5 minutes of usage (again, a linear time/voltage discharge). I looked for one "weak" cell in the string, but each cell was similar to the others at any given point in time. I tried this test only on one set of 4 cells purchased at the same time from a local retailer.

Does this experience match yours? Is 5 amps too much to ask of one of their "D" cells? I expected the cells to have greater energy storage capacity than 4AH 1.2V D-cell nicads, but in fact this doesn't seem to be the case in my experiment. The cells are not characterized on their package (unlike a NiCad) but, believing the advertisements and intuition, I would have expected >4AH by a considerable margin. Has anyone characterized these cells objectively?

I have not tried the other size cells. I'm posting this here because this test was a pre-cursor to use in some ham (ATV portable) applications where I needed higher energy storage density by weight but did not need numerous recharge cycles (compared to NiCads). I believe they are not suitable for this application based on my test.

450. ICOM Radios, AQS and IF Filters

Newsgroup: rec.radio.amateur.equipment
Date: 1994-02-14 13:44:57 UTC
From: seeler@UPEI.CA
Message-ID: <seeler.86.0@UPEI.CA>
Source record: 228078

I would like to ask the readers two questions about the Icom radios -
in particular - the IC275 and IC475.

First - Each has a FM IF filter labeled : CFW 455E. I would like to
know what the band width of this filter is. I can copy 9.6 KB
packet (Ko-23, UO-22) reasonably well - but was wondering
if I shoud consider replacing it with a filter with better
pass band characteristics.

Secondly: CAn anyone expand on the term " Amateur Quinmatic System "
That Icom uses to describe the AQS port on the rear of each
radio. I am aware of the pin information - but was wondering
to what use I can put these ports to other than 9.6 Kb hookups.

Thanks for any information you may be able to provide me in respect to these
questions.

You could always try the same test with 8 batteries in a series parallel
configuration. This should reduce the current drain on each individual
battery, and still provide you with 6 volts.

Good Luck, and 73 Nick N9STF

Hi and thanks for reading this.

I am looking into buying an antenna bridge from MFJ. Does anybody have any experience good or bad with MFJ 203, 205, 207, 208, and 209 bridges ?

I am also looking at the MFJ 249 Frequency Counter. Any comments about this piece of gear will also be greatly appreciated.

Tnx again. I will repost any comments that I get so all will benifit.

> 4 cells purchased at the same time from a local retailer.

5 amps continuous?!? That's one helluva draw! These cells
have a fairly high internal resistance (like regular alkalines), and
at that draw they just plain won't work worth squat. They will work
best in situations that draw about 100mah average or so (maybe a
little more, and maybe less for the AA cells).
Use them in situations where you would usually use an alkaline
cell (and expect *that* to work well). We use them in an HT that's on
a lot, monitoring probably 8 hours per day and talking (medium or low
power) for maybe 5 minutes per day, and they last us probably a week
or so. Nicads *sometimes* lasted the whole day. Alkalines last even
longer, but get expensive fast. The deep-cycle 105AH Marine battery
lasts a very long time but is somewhat less portable ;-)

First, wouldn't gel-cells be a better bet for this type of application? It
seems like a 30 amp-hr draw is a bit much to expect from D cell batteries.

I purchased a package of AA's and the 4 unit charger to see how well Renewals
lived up to their hype. I also picked up a package of 4 Ray-O-Vac alkalines
and three identical single AA flashlights. I loaded up the flashlights with
a Renewal, an alkaline and a freshly charged Millenium nicad and ran each until
the cells were exhasted. The regular alkaline lasted about 9 hrs, the Renewal
quit after 6 hrs and the Millenium gave up the ghost at 2.5 hrs. A second test
yielded almost identical results except the Renewal quit at 5:50.

I've since cycled the Renewal cell 10 times and the life is down to about 4
hrs. It seems to lose 10 to 15 minutes of life per charge. I'm not sure how
a more realistic load would effect the outcome, but I would think that the
deep discharge is probably the worst case for the Renewals. I called the 800
number in the coupon booklet and they are sending me a packet of technical
materials on the Renewals.

After playing with them for a week or so now, they seem like they are ideal
for applications where I would normally use alkalines, but I'm not about to
replace the nicads in my Walkman or PRO-43 which get cycled fairly frequently.
I have a phone and a couple of remote controls that eat AAA's for lunch that
are going to get Renewals, and I have a friend that swears by them for use in
his Sony Watchman where the voltage difference seems to make a fairly big
difference.

Hey folks, looks like it's time to consult the net.wisdom on this one.

I have an old (circa 1960) Channelmaster antenna rotator and a page of documetation that includes the rotator and the controller. From the schematic, it appears that the rotator and controller are just a pair of 90degree windings at about 8 ohms each that are connected together to form a synchro pair?

The only difference between the rotator and the controller is that there is another xformer in the controller hooked up to line AC on one side and with two secondaries hooked up to the "control windings?" in the controller.

I guess I could try to imitate some lame ascii graphics or something :-/

Rotator Controller Rotator

```
-------------------------------------------
| | |
< < |
> > |
< < |
| | |
--/V\/V/\/V\-C-/V\/V\/V\-- ----------/V\/V/\/V\-C-/V\/V\/V\--
| |
> >
< <
> >
| -------------|
```

Whew, that's a bitch! I am not gonna get the whole schem. this way. how about if I just elaborate verbally....

The rotator on the right appears to have four windings connected into two that are not connected in the center, thus forming two 90 degree windings. The two ends are commoned to produce the line I call "common" going back to the controller. The other two lines going back to the controller are the two winding power lines.

There is something in the controller that is the same that I am calling the control transformer for lack of a better term. There is also a transformer hooked up to 120VAC with two secondaries, a switch (probably for direction sense) and a capacitor.

If this is all still too confusing I can try to enter more of the schems.

What I am wonderign is, how to control this rotator. Eventually I would like to hook up to my computer but for now I would be happy to have a box with compass points and a dial on it. I have one of those actually but it seems to be the wrong kind. It has four wires to connect to for one thing and has a solenoid that I think is supposed to move a compass needle when pulses come back from the rotator. It doesn't work with my rotator any way I have tried to hook it up.

Can anybody help me with this? Tell me what kind of rotator I have and what kind of controller I need? Where to get one? Any additional info will be appreciated!

Thanx in advance and 73!
Chris

Jesse,
I have a Kenwood TH78A, and I love it. I've also been out of the market for a year, but it was the best dual band radio I could find. I am also a college student, and I love having an HT. Try operating one with a speaker mic while riding a bike (with the HT in your backpack). That gets interesting.
The 78A might be a tad pricy (mine was upwards of 500 I think), but I also got some toys to go with it. I must admit a brand allegance to kenwood, but that's just me. I know you could not go wrong with a 78, so look into it if you get the chance. On a side note, it looks so cool that you probably won't get any dorks saying "hey, is that a CB?"
I'll keep the post short - mail me if you want more info

It may not be the audio from the TNC -- the 5100's data connection port has been changed recently. I own two 5100's -- one is a year old and one is a month old. The "old" 5100 works perfectly well with the TNC wired into the data port on the back of the radio. The "new" 5100 keys up the transmitter but doesn't provide any audio output when it transmits.

I called Yaesu about this and it seems that they've changed the data port on the back of the radio to allow direct 9600 baud connection. In doing this, they made it impossible to run 1200 and 2400 baud packet through the data port. Wiring directly to the mike connector does still work, so that's the "correct" way to do it now. The manuals haven't been updated to reflect the new hardware yet.

Bummer. Now I've got two "identical" radios and two distinctly different ways to plug in a TNC.

Amateur Electronic Supply or Ham Radio Outlet should have
them... but they are new and you pay for new oats.

There should also be lots of this kind of stuff at Dayton,
if you can wait, put up with the parking, and so on.

>would be welcome. Thanks.

Drake made the FS-4 (Frequency Synthesizer) for the "4" line equipment (R-4 series, T-4X series, and SPR-4). It plugs into an unused crystal socket in the rear of the receiver or xmtr.

It has a VCO (Voltage Controlled Oscillator) which operates in the range of 10.5 - 41 MHz, and is used to provide the crystal oscillator signal. Next is a D-Balancer Mixer, where it is mixed with the signal from the locked oscillator to produce an output in the frequency range of approximately 11-16 MHz.

The locked oscillator develops signals of 5, 10, 15, 20 and 255 MHz which are synchronized to a 5 MHz reference signal. The actual output of the locked oscillator is determined by the settings of the front panel switches. The output is zero for settings of 0 to 4.5 MHz, 5 MHz for settings of 5 to 9.5 MHz, etc. This output is mixed with the VCO to produce signals fo 11 to 16 MHz, which are fed to the bandpass filter.

The bandpass filter following the D-Balance Mixer suppresses any higher order products from the mixer as well as the two inputs and their harmonics.

The output of the bandpass filter is then mixed in the second mixer with the reference oscillator. The reference osc. freq. determines the band edges of the injection output, ie, 16.1 as required in an R-4 vs. 16.09 for the SPR-4 vs 16.0 as required by the 2,C. The resultant output from the second mixer is in the range of 1.5 to 6 MHz and is applied to the low pass filter to suppress any higher frequency outputs.

The output of the low pass filter is applied to a programmable counter, which is programmed from the 1MHz and .5 MHz controls,

and divides the input by an appropriate number between 2 and 12 to produce an output near .5 MHz. The output is applied to the phase/frequency detector, where it is compared in phase and frequency with the resultant .5 MHz signal obtained by dividing the 5 MHz clock by 10. An error signal is developed in the phase/frequency detector which is applied to a voltage variable capacitor in the VCO, and forces the frequency to be such that the resultant input to the phase/frequency detector is the same frequency as that derived from the clock (500 kHz).

The programmable counter is controlled by the 1Mhz and .5 MHz controls, and covers a range count of 10, starting at 3, at dial setting 00.0, and progressing one count for an increase in the .5 position of a two count for each increase in the 1 MHZ control. The counter increases to 12 at the setting of 4.5, and then starts over again at 5.0 and repeats every 5 MHz range of the FS-4.

Hopefully you can make sense out of all of the jibberish I just typed in :-)

Changes: new mailing lists, .packet rmgroup, and .policy updates

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info,
and rec.radio.swap newsgroups. It is intended to serve as a guide for the new
reader on what to find where. Questions and comments may be directed to the
author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 18 September
1993 to add the mailing lists for the new rec.radio.amateur newsgroups, to
note the rmgroup of rec.radio.amateur.packet, and to officially retire some
(in)famous threads of discussion on rec.radio.amateur.policy.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began
to dominate other topics in the group and on the list. This resulted in the
logical solution: a group was created to hold the packet discussion, and
another corresponding mailing list was created as well: net.ham-radio.packet
and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great
Renaming essentially unchanged, moving from net.ham-radio[.packet] to
rec.ham-radio[.packet]. Readership and volume grew with the rest of the
network.

The INFO-HAMS mailing list was originally run from a US Army computer at
White Sands Missile Range, SIMTEL20. There were few problems with this
arrangement, but one was that the system was not supposed to be used for
commercial purposes. Since one of hams' favorite pastimes is swapping
gear, it was natural for hams to post messages about equipment for sale
to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use
restriction, and after some argument, a group was created specifically
```

for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize

this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, should be removed by September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas,

commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
===========================

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

It would help your search if you could be a bit more specific. My 1992 Bird

catalog lists at least 8 elements in Range D (200-500 MHz), plus five other

lower power elements in narrower bands that include 440 MHz. They also have
at
least 13 different models of wattmeter to accept the elements. Keep in mind
that
the element you use wil affect the accuracy of the readings - 5% of full
scale, so don't expect much using a 100 watt element forward to read 1 or 2
watts reflected (+/- 5W! - I've often wondered what negative reflected
power was!).

A comment on the TH78A. I think it is a great radio with the following exceptions: 1: Cannot be used on external antenna on 2M due to horriffic intermod problems.
2: The battery release latch will occasionally trip when wearing on your belt, resulting in an unplanned battery drop test.

I think what you have are called SELSYNS. I have a c1951 Air Force Radar
manual that describes them in some detail.
Manual states they are also called SYNCHRO, AUTOSYN, and SYNCHROTIE.
Try looking in some OLD radar/radio books.
My book is titled 'Radar Circuit Analysis, AF Manual 52-8'.

Announcement
VSS: Vintage Solid-State Maillist

Purpose of the list
The Vintage Solid-State (VSS) maillist is for the discussion
of older solid-state communications equipment that is
of interest to the radio amateur and other experimenters.

This equipment includes test equipment (signal generators,
oscilloscopes,...), receivers, transmitters and accessories
built in the 1960's and 1970's. Manufacturers of interest
include Hewlett-Packard, Tektronix, Motorola, Racal,
Heathkit, National, Atlas, Drake and others.

Discussion will cover what's available, recent prices,
what to look for, what's good and what's not, maintenance
and restoration, where to find documentation, etc.

List maintenance
The VSS maillist is managed by an automatic list processor.
Each list member is responsible for sending appropriate
subscribe/unsubscribe commands to the list processor to add
his/her name to the list.

Subscribing
Send an Email message to the list processor at: vss-request@acm.org

In the body of the Email include the message:

subscribe vss insert_your_name_here

The address of the user sending the message will be added
to the list. Include your name as the third parameter,
format is not critical.

Unsubscribing
Send Email to the list processor at: vss-request@acm.org

In the body of the Email include the message:

unsubscribe vss

This mail message must be sent from the account receiving
mail from the list.

List owner
If you have problems or questions you may send Email to the
list owner at: chatters@acm.org

468. Pkt satellite receiver card for PC?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-02-15 15:35:50 UTC

[Q 1]:

I would like to know if there is an ISA-bus card which acts as
a satellite receiver that I can plug into my PC. My "project"
involves a satellite dish with coax cable receiving a packet RF
transmission which I would like to run into my PC for decoding.
The data would then be displayed under Windows3.1/NT/whatever.

[Q 2]:

What are Phil Karn's KA9q C functions?

If my questions don't make sense it's because I'm new to this
and don't know much about packet radio.

Thanks

Bird is a good source. :-)

Dielectric Corp slugs will work too, and may be more available, or cheaper. Most of the major two way and ham suppliers list slugs in their catalogs.

|> Thank you.
|> CF Lee, ve7lcf

You are correct, that is exactly what it is. I have one in operation now myself. Its output can be fed into a crystal socket of the 2M radio, and then it becomes synthesized. But keep in mind that the GLBs were customized to work at whatever frequency the crystals were, and that differs for various radios. Hence it may not work in your radio without modification. It requires 12VDC to power it.

I didn't notice any noise when I used the cig plug. I also used 14 gauge wire
w/o any problems. The 580 will put out 5w on 2m with 12V in. Another important
fact to rememeber is that when the external power plug (located on the side of
the rig) is used, the battery is not connected electrically to the radio. So
your car can't charge your battery by using the plug. It's in the manual
somewhere.

Yes, they were meant to convert a crystal-controlled 2 meter radio
to synthesized operation. I use one on an old Johnson Fleetcom
commercial radio for my packet station. They had a characteristic
1.66 kHz whine in the audio (PLL reference frequency), but other than
that, they work fine.

They were customizable for many different radios with many different
crystal frequencies. If you don't have the proper modification kit
for your radio, it shouldn't be too difficult making one up if you
are comfortable with designing simple RF circuits.

I have the manual. Let me know if you want me to photocopy it for you.

Message-ID: <2jrg0r$b32@charm.magnus.acs.ohio-state.edu>
Source record: 228004

In addition to the FS-4 previously mentioned here, another small company used to make an analog VFO kit that accomplished nearly the same thing. It plugs into a crystal socket, and it contains a separate 500khz crystal calibrator. You use the calibrator to set the VFO to the 500 khz segment you wish to receive, and then it works just like a crystal. It runs from 12VDC. I think the guy who made them is K9ZMU. They are of course not as stable as a crystal or synthesizer, but it is not too bad, and certainly good enough for listening to short wave broadcast stations.

Note that there tuning ranges that do not work well even with the intended Drake crystals because of IF mixing problems, and that problem is much worse if you intend to use a substutute device to control an associated T4X transmitter.

From: ralleger@gandalf.ca
Message-ID: <2jris9$47t@hobbit.gandalf.ca>
Source record: 228005

I am selling an ICOM IC-229H 50-watt 2mtr mobile radio. The radio is in excellent condition and the manual and mobile mounting hardware are new. I am selling because I bought a dual bander for the car and want to purchase an ICOM IC-W21AT dual bander HT and therefore need the money.

This radio includes a battery-backed DTMF microphone that contains DTMF memory storage for phone numbers, etc.

Amateur Electronic Supply (AES) is currently selling this radio for $480 new. I will sell it for $340.

If interested, please reply via E-Mail.

73,
Bob.

478. Re: rotator ???

Newsgroup: rec.radio.amateur.equipment
Date: 1994-02-16 00:23:23 UTC
From: jstroppe@franklin.uhl.uiowa.edu
Message-ID: <2jrp1r$3d@nexus.uiowa.edu>
Source record: 228006
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.swap

I wonder if your rotor isn't just an induction motor that has a run capacitor
which determines the direction and a small gear train to reduce speed an
increase torque. Syncro's have littel torque not enought to turn an antenna.
The cost of these were quite high. Most rotors had some other type of system
to get direction. One used a set of contacts that made and broke with motor
rotation. Kinda like a KERCHUNK sound at the indicator end when the rotor
was turning.
The other had a variable resistor mounted in the rotor and sent back
some signal to a meter in the control. Radio Shack had anoter type that
had a syncronus motor in the control unit which moved a direction disk at
the same rate as the motor on the antenna.
Most all of these motors were run on 24 vac. (the stepdown transformer
in the control unit 120 to 24vac). This let you use low voltage wire
and not run into complications with the 120vac line voltage. The capacitor
in the control unit is an A.C. motor run capacitor. If it gets weak the
rotor torque goes way down.
Hope some of this was of help

479. Re: Yaesu MH-29 speaker/mike audio levels

Newsgroup: rec.radio.amateur.equipment
Date: 1994-02-16 03:08:40 UTC
From: kennish@kabuki.EECS.Berkeley.EDU
Message-ID: <2js2no$44l@agate.berkeley.edu>
Source record: 228007

I am posting this because many people wanted a summary of what I found.

(Recall this is regarding low audio modulation levels using a MH-29
mike with an FT-530).

It seems that the source of this problem is a combination of poor
design and poor QC. I was able to demonstrate that a different
unit performed much better and was able to exchange my mike for
a new one. As far as the design problem, it was pointed out
to me (see article below) that Yaesu had neglected to put a hole in
the case for the mike. I have verified this. A bit of exploratory
surgery showed that there were no paths from the backside either.
The mike element is in a sealed chamber!

My suggestion: If you have a problem. Try another unit -- it
worked for me. Otherwise, you may have to resort to the drilling
suggestion as described below. (Warning: I take no responsibility
for the contents of the included article. Caveat hacker.)

I am the newsletter editor for the South Peninsula Amateur Radio Klub (SPARK).
I'm looking for ham related clip art to use in the newsletters. If you know where I
can get some, preferably in the public domain, free, etc, please let me know by
e-mail. I can get things via anonomous ftp. I can also convert most encoding formats
that might be used in e-mail attachments.

Thanks, and 73.....Gary, WA6SUW

487. IC-W2A problems ticking on 440mhz

Newsgroup: rec.radio.amateur.equipment
Date: 1994-02-16 15:19:12 UTC
From: Aaron Wohl <aw0g+@andrew.cmu.edu>
Message-ID: <0hMXZka00WA1E1vG5O@andrew.cmu.edu>
Source record: 228014

ICOM W2A
On 440mhz transmit the red transmit LED pulses about once per second.
If you watch the power output it pulses at the same time. If you
transmit into a dummy load for 60seconds or so at full power so the back
of the unit warms up then the problem goes away till it cools down.
Eventually the transmit section fails.

Sound familure? I know of two radio for sure and I heard tell of 13
more. If your radio does this let me know I am trying to find a good
fix for this common failure mode.

488. FT-5100 vs. TM-732A - Recommendations?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-02-16 17:03:24 UTC
From: peterson@physc1.byu.edu
Message-ID: <1994Feb16.100324.1373@physc1.byu.edu>
Source record: 228015
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

The Amateur Radio Club here at BYU is considering purchase of a new dual-band mobile system for general use as well as for emergency communications. We have looked at the range of radios available and it appears that the front runners are the Yaesu Ft-5100 and the Kenwood TM-732A (possibly the Kenwood TM-742A but the price is a little high). These radios all have the dual in-band receive and the cross-band repeat functions. The Yaesu also has the data jack (recently discussed as really nice for 9600 baud but useless for 1200 baud packet) that is appealing. However, the ads never talk about such things as intermod problems and quirks in operation. I would appreciate any feedback from anyone - both positive and negative - on these radios. Especially if you have used both of them. The RF environment is not extreme in this area but is getting worse so intermod and imaging problems are a concern.

Thanks for any help and information you can provide.

Message-ID: <1994Feb16.190645.19904@news2.den.mmc.com>
Source record: 228018

Hello! I know I saw some thread on the subject of comparing
these two HT's. I realize that the FT-530 is smaller and newer
but I can't remember what was said about out-of-band receive
coverage, power, anything else?, etc... Most everyone was saying
buy the new FT530 vs. a new FT470, but I have the potential
opportunity to buy a used FT470 for about $125 less. Feel free
to Email if you feel the internet bandwidth has been used enough
already for this. Thanks in advance for any help.

Source record: 228027

Hi,

I am thinking about getting a Kenwood TS-440S or a Yaesu FT-757GX.
I would be most interested to hear about your experience with either
of them, or even better a comparison between the two.
Also: any alternative suggestions, e.g. how inferior would a TS-140S or
FT-747GX would be?
My main requirement is good RX performance and I also need a computer
interface to store VFO and mode data, and for the remote control
of as many functions as possible.

Many thanks,
John

2m handheld, circa 1982? through ? Certain production series had LCD problems (display turned dark), but mine has never done so. The standard battery pack was 8.4V, 450mAH. The speaker-mic jacks are held in place by the solder joints on the PCB, so be prepared to resolder if you use them very much. CTCSS encode adjustment is potentiometer type. TX power is 300mW/2.5W. Memory 0 is used for "odd" offsets. 73, de KA4GHX

From: elmquist@ribs.ssesco.com
Message-ID: <CLDxLH.IrG@ssesco.com>
Source record: 228031

A few years ago I saw an ad from a small outfit in Texas that was producing some FM ATV transceivers for 900 and 1200 MHz. They had a neat 70 MHz IF that went between the tower mounted transceiver and a control box/mod/demod in the shack. The transceivers were even synthesized...

I can't remember the name of this outfit. Does anyone know and if so are they still around ?

I'm also interested in any other sources of FM ATV gear for 1200 MHz...

I outbid someone at our club auction for a motorola MICOM model L70SCC-1180AM HF ssb rig. I took the silly thing home, and was lucky to find that I had crystals to get it going on 160, 80 and 40m. Of course, it's USB only, but I did manage to have 0.5 dozen QSO's on CW.

It seems that the RX sensitivity is down a bit. Can anyone tell me how to peak the RX? How are the band pass filters selected? Any info would be appreciated!

jsteinhu@nyx.cs.du.edu

It's a 2-meter handi-talkie, .5 or 3 watts out, 10 memories, standard splits
only, except for the tenth channel, which can be used as a transmit freq.
Does simplex, +600kHz, -600kHz, and Memory (channel 10). Uses the BP25
battery pack, eats battery packs about every 3 years, weighs half a ton, and
is probably about 10-12 years old. Has memory scan or range/increment scan
capabilities, seems to be pretty immune to intermod.

I have two of them and like them both...

I have a couple of mobile docking stations which I use with a 25 watt amplifier
and an external antenna in the cars, then switch to the ducky for belt/handheld
use.

Cheers,
Carl

It will DISPLAY up to 520, but you will note that after about 487 the decimal point disappears, meaning that the PLL will not lock and you will not actually receive anything. It will also display down to 810 but will not lock below about 860. The 487 and 860 numbers depend on the individual radio, but that is what mine does. Bye...

Message-ID: <2k3i4p$ihh@jethro.Corp.Sun.COM>
Source record: 228040

hi, folks,

Here's another question regarding my DJ-580. I take this rig with me on the car, and I didn't use any mobil antenna. But the reception didn't even hurt for a little bit. The sound still clear and loud. I wonder if I transmit without using the mobil antenna, will it be effect by the car? Will the range being cutting off by the car body? (I did it when window was closed.)
If the answer is no, then why people want to install the mobil antenna? What I thought was ham use 2m repeater all the time, so the transmit power is not a big concern. As long as the power is enough to reach repeater. It doesn't make sense to get a 100W transmitter or a full length antenna. Am I right?
The other question I have is how to get autopatch access code for public repeater?
Any answer will be appreciated!!!

516. Hardline / heliax

Newsgroup: rec.radio.amateur.equipment
Date: 1994-02-19 03:13:05 UTC
From: kinzer@dtsdev0.sps.mot.com
Message-ID: <1994Feb19.031305.18610@newsgate.sps.mot.com>
Source record: 228043

I'm considering building up a satellite station, and the first thing
I need to get figured out is how to run a high quality feed system.
My operating station is about 80 feet from the proposed rotator position
(as the coax runs.) This means I need to pay particular attention to
low loss in this system.

I have discovered I know little about these expensive feed lines, and am
looking for information on what kind of losses are involved by cable
type, where I can get detailed information, and finally where I can
get the actual cable and connectors. I would prefer to run a 50 ohm
system throughout, since that is what is expected at the transmitter
and presumed antenna systems. I do know that cable companies sometimes
have leftover pieces, but it is usually 75 ohm cable. Any pointers
would be appreciated.

Amateur Radio Net

Amateur Radio Net is a net dedicated to Amateur Radio enthusiasts. If
you are an Amateur Radio enthusiast, or any of your callers are, this is
an echomail network for you. ARnet is replacing an older ham radio
network that recently folded - RF-Net(tm).

If you would like to get more information about this net, please look
for the information packet ARNET024.ZIP on the following BBS's:

Channel1
SaltAir
Mustang HQ BBS
Execnet
Intelec
Sound Of Music
and the Network Host BBS - The Silicon Garden.
It can be FREQ'd from 1:2619/211 using a magic name of ARNET

ARnet is available via QWK & FIDO. As this is the initial announcement
of the net many HUB positions are still open.

If you have any questions, please contact me.

Daniel: here's a reprint of the second project I posted on .homebrew.

Jeff NH6IL

****
Subject: Project 2 - 20 meter QRP CW xmtr

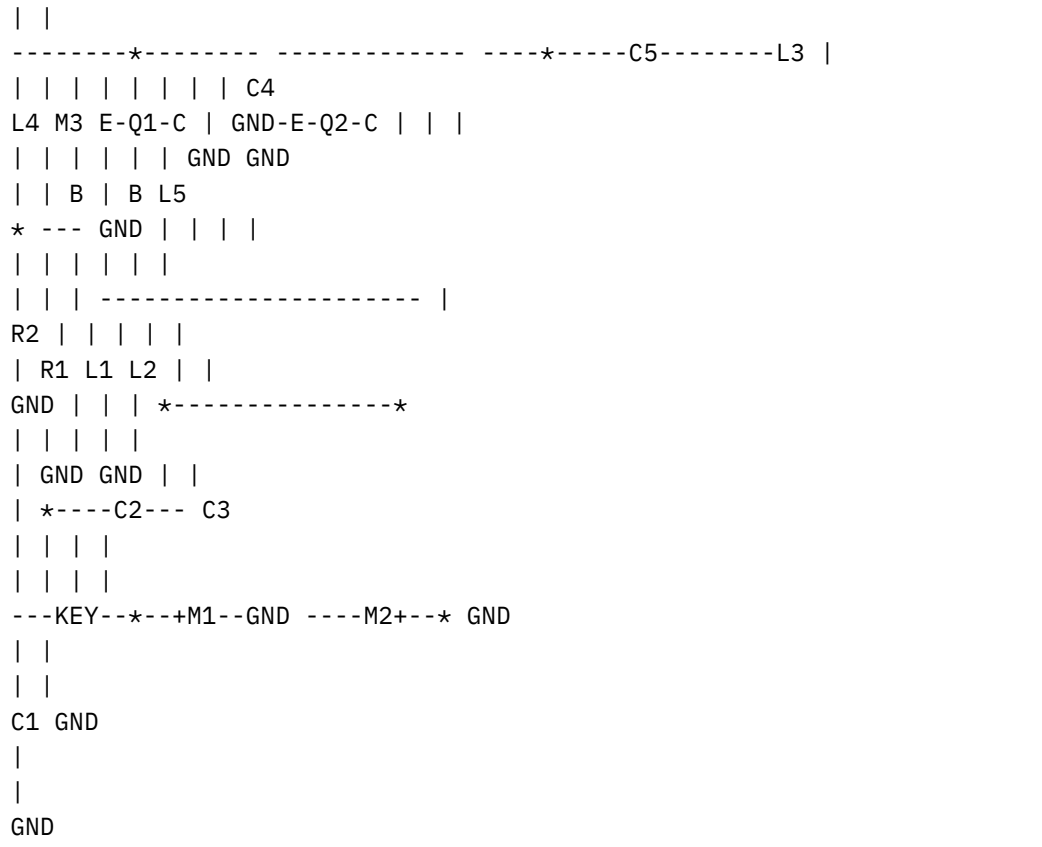
Here's the second QRP project taken from 101 EASY HAM RADIO PROJECTS,
by Robert Brown and Tom Kneitel; again, since the book is out of print,
I assume there will be no copyright problems...
This project is a simple 20 meter CW xmtr with output about 100 mw (?).
Here are the authors' comments:
"If you have always wanted to try low-power on 20 meters, here is an
excellent method for joining the growing ranks of flea-power addicts -
and doing it inexpensively. This circuit is capable of world-wide QSO's,
given the right conditions and assuming QRM is not present.
"The transmitter uses a pair of GE-1 universal replacement transistors
in a unique circuit configuration a great more sophisticated than you
would normally expect for an under-one-watt rig. Crystal can be a
fundamental 14-mHz type.
"L1 should be adjusted for sure-fire oscillation every time the
key is depressed. C4 is simply adjusted for maximum output on the FSM."

PARTS LIST:

C1, C2 .02 uF capacitors
C3, C5 .002 uF capacitors
C4 51 pF variable capacitor
L1 38 turns of No. 22 enameled wire on a 1/2 in. diameter
slug-tuned form
L2 8 turns of No. 22 enameled wire wound over cold end of L1
L3 Coil, 17 turns of Air Dux 616T (or equiv.) tapped 5 1/2
turns from cold end
L4, L5 2.5 mH rf choke (National R-100 or equiv.)
M1 1.5 volt dry cell

M2 6 volt battery
M3 14 mHz crystal
Q1, Q2 GE-1 transistors
R1 180 ohm resistor
R2 1.1 megohm resistor

As before, rather than trying to `draw' the symbol for each component, I've just inserted the part number. Oh, note the polarities of the batteries M1 and M2. GND = ground, ANT = antenna, E = emittor, ANT C = collector, B = base, KEY = well, this is a CW rig.... |



Note that the collector of Q1 `jumps' over the hot end of L2; this is the only jump. * = a junction of 3 or more leads.

.... .- ...- . ..-. ..- -. !

>Russ (WD0FTF)
>

I have an FT530, which is replacing my former FT470.

Both radios are very nice, and, yes, the FT530 is smaller, in addition to having more features.

Frequency-wise, with solder pad 13 removed, it can receive: 110 - 180, 300 - 500, 800 - 950.

It has am AM detector for aircraft, but the detector must be manually turned on and off. I think it would have been nicer if Yaesu made auto-detection for that area.

In addition to this, it has a voltmeter and clock w/ alarm.

Finally, it has TRUE dual in-band receive (vhf+vhf or uhf+uhf), so you can monitor two repeaters (or two of anything) on the same band.

I'm very happy.

Assuming that you are talking about frequencies in the UHF range, then something like 7/8" Heliax would do quite well. Heliax is sold by Andrew Corp. who are big on cable and microwave stuff. The 7/8" hardline has about 0.88 dB loss per 100 feet at 450 MHz. Beware...this stuff is NOT cheap (read several $/ft). If money is a big problem, the next smallest size is 1/2" which has 1.52 dB/100ft at the same freq. Motorla has a spec sheet on the stuff. If you have a Motorola office near you, ask them for document R3-3-12G. Heliax is 50 Ohms.
Good luck

No joy here, either. I've been asking and watching for some time now
and no one has volunteered anything. So...
You know, of course, that the extended receive (sorry, no 440; 130-174
only) is enabled by resetting the radio; turn unit off, hold "Function"
button and "Lamp" button while turning unit on. It _does_ reset the radio,
erasing any frequencies in memory.
Extended transmit (130-174) is enabled by removing the bottom plate
(battery connector etc.) and clipping the pink wire which is looped around
a connector near the left side, then resetting the radio as mentioned
above. Again, this erases your memories.

Now, does anyone know what the connector pads (SLC, XWR, SDA) are
there for? I haven't scoped anything yet, but SLC and SDA go to the
EEPROM, and all three go to/from the microprocessor. Only conceivable
guess I could make is that they could be used with a special adapter by
the dealer to pre-program the memories.

I have >100' run distance (due to serious fit of stupidity I located the
tower ~90' from my radio room). My solution was to run 117 VAC out to the
tower base and have a small metal cabinet containing a P/S and a brick.
The only measure I took was to consider loss to the box in amp drive levels.
This way the only remaining feedling was from the base of the tower up to
the antenna. I've even tried transverters out in the outdoor cabinet).

Good luck!

At the local RF house, (shamelss plug: Advanced Electronics, Gardena) the
Andrew 1/2" line is about $3.70 a foot. The connectors are $50 each.

From: davids@truevision.com
Message-ID: <2k9fih$4l9@epic.truevision.com>
Source record: 227959

I am looking for recommendations for headsets with boom microphones. I will use them with my Kenwood TS450 and my Yaesu FT530. I would like to find one with one earpiece for the FT530, and two earpieces for the TS450. I have seen several inexpensive ones that were attached to some Radio Shack walkie talkies, and one that came with a sound blaster type board, but I don't know of a source for these. I have also heard of an expensive brand called Heil. Are the Heil ones worth the cost, and does anyone have a phone number for the Heil company so that I can get a catalog.

Thanks for the help,
-David N9PGH

Have you made contact with the Motorola Canada sales force? They have a
full
set of operations and service manuals for this unit available from their
Parts Department. Don't expect this unit to have quite the same bench test
(ideal)
sensitivity as the stuff rolling off today's production lines, but when the
noise floor is 10 microvolts, you won't care anyhow.

You will find that the Heil units are carried by Amateur Electronic Supply (AES)
in their mail-order catalog. They are also available from many local amateur
stores-have you checked with your local dealers?

I agree with Scott. I had the FT-470 when it first came out and replaced it with the 530 when it was introduced last year. It is a wonderful radio and well worth the extra $125. As a matter of fact, that is NOT a good deal even! I sold my FT-470 with speaker mic, extra batteries, dc pack and case for $250. The Ft-530 cost me $409 out the door. last year at Dayton they were briefly available for $375 at a couple dealers.

Cross-posted to: rec.radio.shortwave,rec.radio.amateur.equipment

I read a few catalog descriptions and Tom Roach's
Usenet review of the pricey Watkins-Johnson HF-1000
receiver. Can someone with an HF-1000 answer these
questions?

1. Does the HF-1000 have a passband tuning control
which functions for SSB? AM? The Grove catalog
mentions the passband tuning only on CW, but the
EEB catalog doesn't specify.
2. What bandwidths are available for FM reception?
3. Is the notch an IF notch? Does it affect the AGC?
4. How many VFOs (not memory channels) does the HF-
1000 have?
5. Is a service manual furnished with the HF-1000 or
is it an extra cost option?
6. Is there a squelch control? Does it work on all
modes?
7. When scanning memory channels, I want the receiver
to only resume scanning a few seconds after the
signal disappears. I don't want the receiver to
resume scanning in the middle of a transmission.
Does the HF-1000 support such operation?

Thanks.

In a previous article, kinzer@dtsdev0.sps.mot.com (Dave Kinzer) says:

>
>system throughout, since that is what is expected at the transmitter
>and presumed antenna systems. I do know that cable companies sometimes
>have leftover pieces, but it is usually 75 ohm cable. Any pointers
>would be appreciated.
>
>-dave

There was a fellow advertising in 73 magazine who sold 1/4 wave matching units
for 75 ohm CATV cable. As well, I recall seeing an article in the same
rag which actually described how build these matching devices using
copper pipe/tubing and type N connectors. I will try to find this article
if you wish.

I recalling seeing something in QST technical notes suggesting using a
copper pipe reducer to fit the type N connector to the CATV cable.
Then ensure the 75 cable is cut to a multiple of 1/2 wavelength.
(taking into account VF)

I got over 100 feet of 3/4 inch 75 ohm hardline from my local cable
company for FREE!! It's still sitting in my garage awaiting the
installation of a tower. I used the spool for a picnic table.

Another ham E-mailed this very suggestion as well, and thanks for the input. The limitation of these is that they work at one frequency. I tend to have great interest in fiddeling with one thing, getting it to work, using it for a while, and going on to the next. On the other hand, running the cables through my house is something I'd rather only do once. Thus is born my desire to have 50 Ohm cabling, which is 50 Ohm at any frequency. My 2M/.7M desire of today is likely to turn to 1.2GHz at a moment's notice (or is 6M next? Who knows?!?)

I suppose I could run the 75 Ohm cabling with 75 Ohm connectors, and build the matching sections for each band externally. Given the difficulty of this installation, (I still don't exactly know how I'm going to do it,) I wouldn't mind putting some bucks into it to get it right the first time.

> N3RKD

Often when I talked to people they were able to guess I was using
an HTX202 based on the audio levels. I took mine to the local
repair center, and the tech said mine was about as low as he had
seen it. I think it is more like a quick adjustment rather than
a mod.

I believe it works better now, because I have asked folks and they
say that the audio is sufficient.

By the way, record all of your memory settings. When you get your
radio back, its memory will be clear.

Yes, it is possible and done quite frequently. RF Concepts, Mirage, and
other manufactures make 2m, 440, and 2m/440 amps of various output power
levels (and prices to match). Check in any radio equipment catalog for a
full listing. A basic 2m model will run about $200 (+/-) new.

A handy device if you happen to own a large boat, but you don't ever
want to have to press that "AGROUND" button....

The public address system in it would be useful, but the button noises
would tend to annoy people after a while. Example: FOG1 is probably
a four second blast every two minutes.

And you can get them used for CONSIDERABLY less. A 2 in/30 out 2 meter
amplifier WITH preamp can be had for about $100 used, and sometimes
even less. I picked up an older VoCom 2 in/25 out 2 meter FM amp that
does the job. It's ugly. It's VERY small and gets REALLY HOT.

It also cost me $20 at a hamfest, and I've been using it for 6 years!
I picked up an identical one at a yard sale last year for a buck! And
it's in better shape than the first. Now there's one in each car.

I am just getting into amateur radio and would like some advice/opinions on equipment. I am currently studying to take all test elements at one time to get my Extra class license. In the meantime I have been kind of looking around at radios and such just to get a feel for prices. I would like to get the net hams' preferences/comments about rigs they use or have used, things like quality, performance, etc. Initially I will be looking at HF rigs, something post 1980 or so. I am also welcome your comments on older rigs, especially some of the proven performers like Drake and Collins. Information about VHF/UHF rigs is also appreciated as that purchase will happen, just a bit further down the road.

Email or post

Thanks,
Mike Serafin

Hi Trey:

It sounds extremely like an electronic fog horn/power hailer for use on a boat. I used to have one built by (well, built by me, but the product of) Heathkit, which was, in case anyone cares, a GREAT device which I stupidly sold when I sold that boat.

FOG1 & FOG2 are different noise/silence patterns depending on whether you're in offshore or inland waters (if memory serves) and AGND I assume stands for "aground".

Sound reasonable? Was it really a mic jack you're used to seeing on a rig? Or a simpler one since it's only a P.A. (Maybe an intercom, too, depending on the model...)

>Do the amplifiers for use with 2 meter HT's require a separate power
>supply? That would up the ante in getting one.

If you are looking into one for your home, yes you need a supply. In your car, of course, you just hook into the 12v system. A cheap way to operate a 12v amp in your house is to buy a decent size Gell-Cell (SLA) and float a charger across it. The battery will give you all the current you need and can be obtained from swap meets etc. The charger does not need to have a high current output (1 amp would suffice). One thing to keep in mind is that using this method, you can't talk all day long and expect the battery to hold out. SLA's can be deep cycled, but will last much longer if you can avoid deep cycling.

I read a note somewhere that 4.06 was available from some FTP site.
Well super Morse 4.10 is out and available on Compuserve and possibly
somewhere on the NET. If you can't find it, let me know and if someone
tells me how to get permission to PUT it on their FTP server, I can send it
there.

Hi gang,

I picked up this rig at a local hamfest and need to do some work
on the mike audio and also find a good place to inject the signal from a
new PL tone board I've installed. I have a complete owners and
alignment manual for the rig minus the fold out schematic. Do you or
someone you know/love have the schematic?

If you have the same rig and have done some work on it I'd be
glad to carry on a discussion of interesting mods.

Your help would be most appreceiated!

HI,

I am working on writing an article whose purpose it will be to help new
hams in their search for used HF gear.

I am very interested in personal opinions/comments that might help in
this matter.

here is the proposed outline:

HF Rigs, Buying Used Gear

- Some tubes vs all transistors and what it means to ham
- what bands does it cover (WARC?)
- what modes does it have (CW/SSB/FM/FSK)
- built in vs. external power supply
- size
- price range
- extras: RIT,XIT, adjustable IF, filtering, computer control for banswitching and such,
option available, dual VFO and its use, speech processing, other
- good bets in different price ranges
- is rig especially good on one mode (cw vs ssb)
- can rig be easily turned down to QRP levels (optional section)
- built in cw keyer or filters

thanks...

73

Message-ID: <2kmkuv$e2b@senator-bedfellow.MIT.EDU>
Source record: 227855

Hello. I am not sure if this is 100% relevant for this channel, but I figure that the people that would know anything about the area of my question are subscribed to this channel.

I am a student here at MIT that is implementing a project to "track" the MIT shuttles, so that students logged into the network will be able to find out where it is and when to wait. In order to do this, I was probably going to use a numerical code, transmitted using touch-tone (DTMF) encoders and decoders,

In order to do this, however, I would have to use a frequency on which to transmit. Thus, this project then finds itself at the hands of the FCC. I was wondering if anyone out there knows about the regulations concerning broadcasting "beeps" over the range of a few square miles in a major city. This will probably be a signal in the range of 10^1 kW. Which regulations apply? How do I find out about them? What radio bands would/could I use? Any idea as to the efficiency of such transmission?

Anyway, thanks for listening, and I hope someone out there has both the answers and the time to write back.

Those are additional DTMF tone-pairs. Some devices that use DTMF use
them to increase the available signal alphabet. (0-9, *, #, and
optionally A-D.) The Bell System defined these tones when they defined
the rest of DTMF but never used them on consumer telephone equipment.

I am using my Alinco DJ-180 in my 1994 Chevy pickup truck. Even though the power comes from a stand alone battery, I am getting some noise into the receiver. Also, at times I get noise in the AM receiver as well. Any ideas?

Its unfortunate that the original poster referred to the deviation
problem as a "mod". Most (all?) rigs have a deviation (modulation)
adjustment. Apparently, RS was setting them too low on their
early production units. So chances are today's radio is just like
yesterday's except the adjustment is set differently.

MFJ makes single band QRP CW rigs you can get a built in keyer accesory
or audio filter..they are often on the net for as little as $100-$140.

A used Ten Tec Century 22 isn't much and works great at up to 20
watts out with built in audio filter..it is a Direct Conversion
receiver..but a good one. The 21 is older model with built in
power supply.. but recommend the 22 over the 21.. they are both
bultiband..the 22 does 10,15,20,30,40,80 meters.

When I got my first HT last August, I also debated between these two models. They are very similar in features, though the Kenwood has alphanumeric display for paging I believe, and the Yaesu has built-in vox (special headphone mike needed, though). I finally went with the Yaesu mainly for ergonomic reasons. I thought the keypay was easier to use, the Kenwood was a little small, plus the sliding door that covers the keypad makes the bottom numbers hard to hit at times. The Yaesu is a little bit bigger, but not much. Also, the Yaesu has the ability to scan for pl tones being used on a repeater, so you can identify them and program them in.

I'm VERY happy with the Yaesu. I bought it even though it was a few dollars more than the Kenwood at the store. However, I feel you can't go wrong with either one. I almost bought the Kenwood myself, it took me about 20 mintues of handling them to figure out which one I liked best.

I seem to remember hearing that Icom is coming out with an upgraded version of the 737, which I think is called the 737A. They addressed some of the shortcomings of the 737, like lack of VOX and maybe RF gain control and AGC defeat.

Does anyone have any information on that? In particular, I'm wondering if they will be offereing a retrofit change so that owners of 737's can get the new features.

Thanks,

Chris Moore

610. ICOM delta-1A: Why is it popular?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-02-28 18:29:46 UTC
From: rmorrow@afit.af.mil
Message-ID: <1994Feb28.182946.811@afit.af.mil>
Source record: 227887

I've heard that the ICOM delta-1A (the 144/440/1.2GHz) tri-band handheld is quite popular on the east and west coasts, where there is a lot of 1.2 GHz activity. My question is: WHY??? This radio seems to have two significant disadvantages:

- it's large and heavy;

- it's _really_ expensive ($850 street price)

I can't believe that a single extra band is worth the extra size, weight, and price. Does it have superior intermod rejection through electronically switched front end filters (like the R7000/7100)?

What is there about this radio that makes it so popular?

Bob Morrow

Shel-

The service manual does indicate that the peak-deviation adjustment is set for 3.5 KHz. Mine came set to 3.5. I found that with CTCS turned on, deviation was slightly higher, so I set it for 5.0 KHz with tone on. This turned out to be about 4.5 KHz with tone off.

The difference between 3.5 and 4.5 or 5.0 KHz is only about 3 dB, which is barely noticeable on the air. Therefore, the real problem isn't peak deviation, it is microphone gain. Since there is no separate adjustment, all you can do is speak close to the microphone and don't mumble.

With mine, I found that speaking close to the microphone made it work well. I think many people want to be able to speak in a quiet voice, with the radio a foot away. If you insist on operating that way, you will always be cursed with either low audio, or with high background noise!

Adjustments for CTCS and DTMF tone levels are each independent of the voice level adjustment. This is necessary for the CTCS, since the tone must be injected after the voice limiter circuit.

My DTMF levels were in agreement with the service manual, although I forget what they were. The real problem with the HTX-202's DTMF signal, is the fact that the high tone and low tone of each tone pair, are at the same level. Telephone company standards require that the high group of tones be at a higher level than the low frequency group. (I think the required difference is 6 dB.)

To the best of my knowledge, this is the only REAL bug with the radio. I haven't seen it, but I understand there is a Radio Shack service bulletin on adjusting the DTMF level. It reportedly states that you should "adjust it until it works"! Obviously, there have been complaints about problems with autopatch.

From: salvini@wdl.loral.com
Message-ID: <1994Feb28.233621.22556@wdl.loral.com>
Source record: 227893

I recently purchased a used (but not abused) 207R, but it comes with no manual. My other radio (ok, my wife's) is an ICOM IC-2iA, which was really easy to set up for her. This other radio, I'm not quite getting a hang of.

I'm wondering if anyone has a manual/schematic, etc for it? If not, is there somewhere I can get it/them?

I've looked at ftp.std.com, but no such luck.

On that same note, anyone have any mods for the IC-2iA?

Thanks!

Why not call Motorola first? You could get an *original* manual....

First, call (708) 538-0021 for parts ID to help you determine which
part # the manual for this amplifier is.

Then, call (800) 422-4210 to order the manual.

>Anthony Scandurra
>KA2FFS

I was almost ready to buy the 890. I was really attracted to the tiny packaging, the terrific ergonomics, etc. But then a couple folks sent me mail in response to a question I posed much like yours telling me that while it's a great little unit, if cost is paramount, that I should think about the 990 instead.

Am I glad for their suggestion!

When I looked at it more closely, I saw they were right. For about 20% more, you sure get a lot more than 20% more radio! You get quad, not triple conversion, a 10-key pad (oh, that is wonderful!), RTTY and packet modes (with special connectors on the back panel!), more filter options and the "digital" audio filter (actually, it's not digital, but it sure is effective).

Part of the problem with 890 is that it's easy to get hung up on the small size and low price, forgetting you also need a power supply. Add that in and, as I said, you're talking only a 20% difference. I still believe the 890 is nice little rig, especially if you need the small size for use in vehicle, but the 990 is clearly more radio and a better value. I've had mine for about a month and am really pleased.

Chris Moore (cmoore@mothra.rose.hp.com) wrote:
: I seem to remember hearing that Icom is coming out with an upgraded version
: of the 737, which I think is called the 737A. They addressed some of the
: shortcomings of the 737, like lack of VOX and maybe RF gain control and
: AGC defeat.

: Does anyone have any information on that? In particular, I'm wondering if
: they will be offereing a retrofit change so that owners of 737's can get
: the new features.

Well, here is some info that I took from a recent Japanese ham radio magazine
on the IC-737 which is being offered over there. This is a newly enhanced
machine. Keep in mind that Icom will likely change model numbers before
it arrives in the USA (it is a VERY COMMON practice over there) AND it
will likely take a few months before it even appears here. Having said
that - here is the info that I took form the magazine. NO guarantees
as to the accuracy of the info since I only read Japanese ham mags for
fun - not for a living. Also, this message was prepared in response to
a similar query on the cq-contest and/or DX reflectors:

> I have seen a new version of the Icom IC-737 advertised in JA1ELY's
> excellent Japanese DX magazine, 59. The Japanese model number is the
> IC-736. Unfortunately, I cannot read most of the ad copy (it's in
> Japanese). I THINK the radio has the following features beyond what is
> in the IC-737 version currently sold stateside:

> * vox
> * 6 meters (50w?)
> * RF gain control
> * 200v AC internal power supply
> * ALC meter
> * SWR meter

> I called Icom America regarding this rig. Predictably, they've never heard
> of it...

I am also looking over the two page ad in the January issue of the
Japanese CQ Ham Radio magazine. Let me give you a couple of notes on
this thing. Please be aware that model numbers are not always identical
between Japan and export models (e.g. IC-780 vs IC-781). Also, it is
not surprising, nor particularly a bad thing that ICOM America does NOT
know about this rig. After all, wouldn't you want all the bugs worked
out in their domestic market before it hits the USA shores?

Anyway, the IC-736 comes in three basic models:
IC-736 100 watt unit. 238K yen

IC-736M 50 watt unit. 228K yen
IC-736S 10 watt unit. 198K yen

(In case you're wondering, JAs must identify the specific radio they have when registering/applying for a station license. Limitations on power are specific to each type of license. 10w for 4th class ops, 100w max for *fixed* stations and 50w max for *portable* stations; plus a couple others.)

* 100v or 200v AC (easily switchable)
* high speed internal antenna tuner w/70 memories.
looks like the auto-tuner kicks in when SWR is >1.5:1 (except on 6m)
* 50w output on 6m
* Newly developed DDS circuitry provides 1Hz pitch tuning. ex: 50.110.736MHz
* one button SPLIT shifts freq +10KHz
* double band stacking registers
* memo pad
* XFC - transmit frequency check while operating SPLIT
Also - RCV freq can be locked during split.
* built-in electronic keyer
* TWO key jacks in the back - one for keyer paddle, another for straight key or other CW keying.

Other:
Full QSK
CW narrow mode (option) - probably the filter.
Passband tuning
Notch Filter
Dual antenna system (select either of two antennas from front panel)
Multiple meter functions
101 memory channels
AF speech compressor
noise blanker
one piece aluminum die-cast chassis
large display
double-fin cooling system
AH-3 control circuitry

Well - that's a synopsis of what I read in the ad - hope it is of interest.

>Can the MFJ-259 really measure feed-point resistance when it is
>inserted at the equipment end of the coax?
>
>A general question: Can you dependably determine the resonance of an
>antenna by looking for the lowest SWR?

No. This only works if the antenna feed point impedance approaches
the characteristic impedance of the coax most closely at resonance.
That's roughly true for dipoles, but not for some other types of
antennas. For example, a 1/4-wave monopole has a feed point impedance
at resonance of about 36 ohms. At either side of resonance, the
impedance (complex) increases. So there are two points where the
impedance will be closer to 50 ohms than the resonant point. So
if you see 1:1 SWR on your 1/4-wave monopole, there's something
wrong. (In fact as a general rule of thumb, if you have a SWR of
1:1 on any simple antenna which has no special matching network
at it's feed point, there's something wrong.)

> fact that the high tone and low tone of each tone pair, are at the same
> level. Telephone company standards require that the high group of tones be
> at a higher level than the low frequency group. (I think the required
> difference is 6 dB.)

No, the AT&T spec is that there should be *NO* difference in the phone line
levels between high and low groups (called "twist"). Usually the decoder
can tolerate about 3 dB difference at >20dB S/N levels. Better decoders
will have higher allowable levels of twist (up to 6-8 dB) and/or lower S/N
requirements while still decoding reliably.

The problem is that some amateur autopatches are connected directly from
the discriminator (ahead of the de-emphasis filter) and some connect to the
audio stages after the filters. Unfortunately, many hams serving as
repeater engineers seem to regard the two points as only having different
audio levels. They don't realize that the audio response is significantly
different. The result is both poor line audio and problems accessing and
controlling patch functions.

>
> To the best of my knowledge, this is the only REAL bug with the radio. I
> haven't seen it, but I understand there is a Radio Shack service bulletin
> on adjusting the DTMF level. It reportedly states that you should "adjust
> it until it works"! Obviously, there have been complaints about problems
> with autopatch.

This is also a common problem. Many operators adjust the DTMF to the same
level as voice peaks, which severely distorts the tones. The proper level
for DTMF is 3.0 to 3.5 kHz if your rig is adjusted for deviation limiting
at 5.0 kHz. I also recommend that DTMF be sent *WITHOUT* CTCSS, or the
CTCSS must be set to no more than 350 Hz deviation to maintain the 20dB S/N
ratio into the DTMF decoder. Remember that if you take audio directly from
the discriminator, there is no filter to keep CTCSS out of the decoder.

Almost all amateur DTMF/Patch problems can be cured by following these simple guidelines.

I have built one and have a second partially complete. You would certainly
do better buying a TNC instead. DSRI has some with 9600 built in, and so
forth. The biggest advantage I see with the TAPR modem is the ability to
do bit regen, but that is only an issue for your full duplex packet
repeater, not for user equipment.

The FT990 is a fine radio, and is my choice for RTTY especially (RTTY
mode gives you FSK, works for Amtor, Pactor). However the radio is
triple conversion on receive. The FT-1000 is quad conversion.

My biggest complaint with the FT890 (and the FT840, Icom's 737, etc.) is
the lack of FSK. The last portable FSK rig, the IC-751A, just went out
of production. The FT990 is a little large for taking RTTY on the road.

631. Re: ICOM delta-1A: Why is it popular?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-03-01 19:28:39 UTC
From: phil@hansen.ncd.com
Message-ID: <2l0517$j14$1@rosebud.ncd.com>
Source record: 227909

I like my Delta-1A for the following reasons:

1) I am active on all of the bands that the radio supports
(2M, 70cm and 1.2 GHz) To carry around two radios (2M/70cm dual band and a
1.2 GHz) radio is a pain. The size of the two radio is far more than the size
of the Delta 1A

2) Price is not as high as you might originally think... For example a 1.2 GHz
HT sells for about $430 bucks (volumes are low so the price is higher), a good
dual band costs also about $430. So this is a total of $860... $850 is cheap
compaired to this :-)

Phil

Gary, are you *sure* of this? An extrapolation of what you wrote says that if you terminate a 50 ohm line with a pure 50 ohm reactance, the SWR is 1:1. I don't think that's right. When I work the problem out on a Smith chart, terminating a line with a reactance equal to it's characteristic impedance yields an infinite SWR. Taking this to a more reasonable point, the lowest SWR should occur at resonance, when the antenna impedance is purely resistive; any deviation from that point will yield a rise in SWR regardless of the impedance value due to the reactive components. Have I missed something?

I am afraid so. If what you say were true then it would not be possible
to match, let us say 10 ohm resistive, with a 50 ohm system using
only reactive components. But this is not correct.

copied from packet:
From: AK3P@WB3FYL
To: ALL@ALLUSA
Subject: "Up" the power on your TS50

This info is for the TS50 users who would like to get about 100 Watts more out of their TS50's. The "modification" is very simple and does not require any soldering. I have made the mod on my 6 month old TS50 and have had no problem with it. As a matter of fact I run mine at about 225 watts peak out and yes you nay sayers out there it does work and if you don't key the radio down for 6 days straight, it will not kill the finals under normal SSB operation. However I would not run the radio full power in the FM mode. Maybe you would want to run it at a lower power setting, but read on.....

1) Place radio before you, front of radio facing you.
Remove the top cover of the radio. Attach a power meter, a dummy load and a power supply that can deliver at least 20 Amps. If the power supply can't deliver enough current, the radio will shut down upon keying.

2) Locate the small vertically positioned board near the beginning of the heat sink. Note, it's the only board that is mounted vertically near the rear of the radio. There are two (2) small potentiometers mounted on this vertical board. The right pot is the ALC adjustment and the left pot is the SWR shut down setup (so I am told). --> DO NOT TOUCH ANY OF THEM <--

3) Behind the vertical board and somewhat to the left of this board is a small white potentiometer. This is the potentiometer that will set your output power. I set my TS50 to FM mode and keyed it up into the dummy load. Now turn the white potentiometer BEHIND the vertical board carefully clockwise and watch your power meter go up. Set it to the power level you want.

Keep in mind, there is NO noticable difference at the receiving end between 200 and 250 watts, but there is a noticable difference between 100 watts and 200 watts. The least it will do when used mobile, it will give you a "the frequency is in use old man" remark when before, even after asking 20 times if the frequency was in use nobody came back until you established a qso... you get the drift.....

Please Note: the low and medium power settings also change
when this mod is done. Also I would not run full power while in FM mode.
By the way you are doing this mod at your own risk.
Have fun with your TS50.

I am considering a tribander mobile rig, for use at home.
Looking for 2-meter/220/440 or possibly 2/440/1.2Gig.

I'm considering the newer Icoms or Kenwoods. Any advice on
features/durability or any problems you have had would
be appreciated. Thanks for your time!

No, you haven't missed anything, but I did. Comes from posting before
the caffeine kicks in. :-(You're correct that the reflection coefficient
will be minimum, but not necessarily zero, when the antenna is at resonance.
What I said about the impedance being 50 ohms either side of resonance
is correct too, but complex impedances are *vector* quantities while the
SWR equation resolves them to scalars. Arrgh!

No. You're neglecting the phase shift across the matching network.
That's the same as rotation around the constant SWR circle and allows
the transform from one purely resistive impedance to another. When
the reactance is beyond the termination point, that phase shift doesn't
apply. Looking at it another way, the matching network is in some sense
a transformer, while a reactive antenna is not. That was my original
mistake, I neglected to allow for the vectorization of the impedance.

> Is anybody familiar with either the MFJ-249 or MFJ-259 SWR analyzers?
Not sure exactly in what context you mean this, but I have an MFJ-249,
and count myself as a very satisfied customer.

We have used the MFJ-249 on a VHF antenna of unknown, but probable
commercial frequency band, resonance... the 249 showed the
"double-dip" of a "false" resonance and the "true" resonant frequency
with uncanny accuracy. We then put an IFR instrument on the antenna
and observed the same SWR curve and resonance points, albeit with far
greater accuracy, and graphed for us. I'd love to have the IFR (Gary,
I'll take yours when you are tired of it! ;^) but I am not willing to
part with nearly 100 TIMES the bux I have in my MFJ-249.

> Can the MFJ-259 really measure feed-point resistance when it is
> inserted at the equipment end of the coax?
Don't know. The 249 can be calibrated and checked with feedline of
known impedance, and can pretty accurately measure self-resonant
points on the antenna, as long as one doesn't fall into the trap of
thinking a 1.0:1 SWR is required to be resonant! ;^)

> A general question: Can you dependably determine the resonance of an
> antenna by looking for the lowest SWR?
I gotta think about this... in an antenna designed for a feedpoint
impedance of, say, 280 Ohms, I suspect that lowest SWR on a 50 ohm
feedline might come a LONG way from the self-resonant frequency of the
antenna. Guess I need to go back to the drawing boards... thanks for
the thought material...

>something?

If the resistive part of the antenna impedance were a constant
it would be true that adding any reactive component would increase
the SWR. However, if the resistive part changes with frequency,
which it in general does, you can get to a (very slightly)
lower SWR by changing frequency, before the SWR starts to go up.
Explaining this another way: if the resistive part were constant,
the d(SWR)/df at resonance would be zero, and would increase on
either side of resonance to a positive value. However, since
dR/df is not zero at resonance, then d(SWR)/df is not zero at
resonance, and you will be able to go some direction to get to a
lower SWR before the dX/df puts enough X in that it takes over
and puts you at a higher SWR.

Since typically the reactance is changing much faster than the
resistance, I'd expect this to be quite a small effect, and lowest
SWR should occur very near resonance, for things like 1/4 wave
antennas fed against ground, or 1/2 wave center fed antennas.
(I'd want to think more carefully about end-fed 1/2 waves, where
R is max at resonance and the SWR is very high...gut feel is you'd
get lowest SWR at resonance with these, but I think you don't
have to get very far from resonance till the resistive component
is changing more rapidly than the reactive and you actually get
to a lower SWR on something like a 50 ohm line...resulting in
very easy to confuse results.)

No, you are exactly right. Adding reactance in series with 36 ohms
(which is essentially what happens when you tune a 1/4-wave ground
plane off resonance) can only increase the SWR, even in a 50-ohm
system. Lowest SWR occurs at resonance.

Ooooh, gold mine. :-)

>Questions for the net:
>
>1. How should I re-introduce this equipment to power after all these
> years? Visions of leaking capacitors, cracking resistors and
> flaking insulation fill my head. . . .

The main concerns are going to be the electrolytics in the AC-4 and L-4B power supply. If they aren't gone beyond hope, applying power gradually with a Variac, increasing to full line voltage over about a 10 hour period, can reform the capacitors. Replace the ones that smoke. :-)
Next repeat the process with the T4 and R4, the main concern here is in the audio stages. Unless the equipment has been exposed to environmental extremes, that should be all it takes to get it running again.

>2. Should I pay an experienced service shop to bring this station back
> to life and to align/tune it? If so, who would you recommend?

You should *not* have to realign the radios. Don't diddle with anything adjustable, replace any bad components you find instead. If necessary, (unlikely), you may have to slightly touch adjustments in stages where you have to replace frequency sensitive components like coils or tuning capacitors. Changing bypass capacitors shouldn't affect alignment, and most of the frequency critical capacitors are either mica or air variable and shouldn't have deteriorated in storage.

>3. Would I be at a technological disadvantage to use this equipment on
> today's bands, competing with today's high-tech transceivers?

Not at all. These radios are still excellent for basic RF purposes. The
newer rigs have fancy digital displays and "channel" memories, but those
aren't important.

>4. Should I simply try to trade everything in on a modern transceiver?
> If so, would I be able to get a reasonable trade-in for everything?

Lots of people think very highly of this equipment. It should command
a respectable resale price. Even so, however, you won't be able to duplicate
it's basic RF performance for anything like what you get for it. Use it,
love it. (Or give it to me!) :-)

: keating@nosc.mil

The TS-60 has the exact same features as the TS-50 except it works only
on 6 meters.

If anybody is not familar with the TS-50, check QST (not sure what
issue) or email me, I have one of those also.

I have already used it in a couple of E-Sporadic openings and it was really
fun.

I got it primarily because it is very small and will put out 90 watts.

I am looking forward to using it in my car this summer when the E-skip
is hot.

At this point, the only negative feature is the price, about $999.

I have used for many years an AC variable transformer and
start at 10vac and bring up th volatage by 10vac about
every 15 min. I also use a dc adj. supply to bring up
low and high voltage (5-15vdc)&(100-500vdc) in 10o/o
steps. It has worked for me in may old radio shop and
all the old eq. i now get from the goverment sales

The r4 and t4 where good rigs in there day but as
you say do not have the bands of today or the selectivaty
of todays rigs

655. FOR SALE: Kenwood TM-241A 2m mobile

Newsgroup: rec.radio.amateur.equipment
Date: 1994-03-03 21:27:20 UTC
From: steinr@ucs.orst.edu
Message-ID: <2l5kno$dc@gaia.ucs.orst.edu>
Source record: 227933

I have for sale a Kenwood TM-241A for $310. Buyer pays shipping.
It is in perfect condition.

This radio is only 2 months off of the shelf, and therefore
comes with the warranty. It is for sale because I am interested
in the 732-A.

Please reply through E-mail. Thanks.

Although the impedance may be closer to 50 ohms, the SWR will
INCREASE. Adding reactive impedance to a resistive load
will NEVER decrease the SWR. Although the total impedance value
may be closer to 50 ohms, the reactive-ness will just make the SWR worse.
Stare at a Smith chart, and you will see this.

Intuitively, the only way to decrease the SWR is to increase the
amount of power that is adsorbed by the load resistance. Adding
reactance in series with the resistance can only decrease the
voltage that the resistance sees, and reduce the power it is adsorbing.

There are several possible problems. One is the electrolytic capacitors
gradually lose their voltage rating when not used. Applying voltage
allows the insulation between the internal plates to "form" again, but
if you apply it too suddenly, the leakage current will be high enough
to blow the caps. So bringing up the voltage slowly with a Variac is
a very good idea.

Another possible problem is moisture within the power transformer
windings. Again, if you bring up the line voltage very slowly
WITH THE TUBES PLUGGED IN so the filaments provide a load, the
transformer will have a chance to warm up and drive off the moisture
before the voltage gets high enough to arc the damp windings.
When I say "very slowly", I mean over a many-hour period.

: The r4 and t4 where good rigs in there day but as
: you say do not have the bands of today or the selectivaty
: of todays rigs

The selectivity of the R4 filters was pretty good. For one thing, it
came standard with a good selection of different bandwidths, which
are extra-cost options on most modern transceivers. For another,
the R4 has much better front-end selectivity than the broadband-tuned
designs in use today, and the local oscillator has less phase noise,
for better rejection of out-of-passband interference.

It's true the R4 does not have 0-30 MHz receive capability, but you
can buy crystals to add the bands you are interested in.

You are right in your statements but you are wrongly assuming that
the load is purely resistive. At least I know for monopoles and
dipoles it is rarely so over a broad range of frequencies. Feed
point impedance is complex and has both resistive and reactive
components. Cancelling the reactive part is one way of improving the
SWR but not necessarily to that of 1:1. SWR tuners do more than
cancelling the reactive part to make SWR of 1:1.

I'm very new in this field but I hope my explanation is O.K, :-)

: inserted at the equipment end of the coax?

: A general question: Can you dependably determine the resonance of an
: antenna by looking for the lowest SWR?

I'm familiar to neither but I can tell you that you can't determine the feed point resistance using SWR information only. With SWR you can only determine the magnitude of the reflection coefficient. If you wish to determine the feed-point resistance, you also need to have the phase of the reflection coefficient at the feed point. One of the ways of knowing the phase is through determining the position of the first voltage minimum. I don't know if the above analyzers can provide that. If they do, you can always find the relationship between the position of the first voltage minimum with the reflection coefficient phase from many antenna books.

As to your second question, the answer is generally Yes! But be careful, the resonance is also dependent on the reactance (in fact capacitance) resulting from the junction between the antenna and the coax. With different junctions you have different capicitances and hence the resonance shifts even if the antenna is the same. Examples of what makes different junctions is different coaxial lines, different coax connectors etc

The problem you are mentioning (measurement of big arrays) happens
whenever you use a signal-level insturment, both network analyzer and MFJ
VSWR meter. These instruments are designed to measure VSWR of passive
devices only (with no voltage output.) For a large antenna, which always
picks up some signal from the air, your best bet is to use a CW generator
with a few watts output, then use a bird wattmeter to see forward and
reflected power levels. This way no incomming signal can compare in
amplitude with a few watts you are using.

Most importantly, welcome back to the amateur radio HF bands! You'll find that propagation isn't the same as when you briefly powered up the Drake line,
but the hobby has grown to include many new digital modes. Have fun, and again welcome back. Many of us will look for your "OLD" call during contests.

Smitty, NA5K, (henrys@netcom.com) wrote:

: A general question: Can you dependably determine the resonance of an
: antenna by looking for the lowest SWR?

To which there has been quite a bit of discussion. I already posted a
to-the-point observation about that, but here's some more food for
thought:

Why do you necessarily _want_ to operate an antenna at resonance?

Case-in-point: consider a nominally 1/4 wave radiator above perfect
ground, something that can be approached at least with a good ground
radial system or a ground plane of wires or (automotive) sheet metal.
At resonance, the antenna looks like 30-something ohms (say about 36),
purely resistive. Below resonance, the resistive part of the feedpoint
impedance drops, and the impedance has a series capacitive reactance.
But above resonance (in other words, where the antenna is longer than
1/4 wave), the resistive part rises and the series reactance is
inductive. The resistive part increases smoothly, till we get to
antiresonance at about 1/2 wave long, where the resistance, highly
dependent on diameter/length ratio, will be in the vicinity of 1000 ohms.
That means that somewhere a bit longer than 1/4 wave resonance, the
resistive part must have passed through 50 ohms. If we can find that
point, then we need only put some capacitance in series with the
feedpoint to cancel out the inductive part of the antenna feedpoint
impedance, and we can get a perfect match to 50 ohms!

Now where might we find an installation where there's a ready-made
series capacitor? Well, consider thru-glass antennas on cars...if
we make the mounting plates the right size to get the right
series capacitance, it can exactly cancel the inductance of a
1/4 wave++ radiator. I believe this is quite practical for at least
2 meter installations. See the QST article on thru-glass antennas
from about May 93, I think; it doesn't explain _why_ the system works
well, but the thoughts here should help you get a better match if you
decide to use this system.

And in feeding a home-made vertical above a ground system on HF,
a variable cap at the base, in series with the feedline, seems like
about the simplest of matching networks.

From: mike@garfield.csuohio.edu
Message-ID: <1994Mar4.194031.25091@news.csuohio.edu>
Source record: 227796

Looking for help from some of you antique SW equipment buffs.

I have a shortwave receiver that my father purchased in England at a flea market (on Portabello Road most likely, a well known area for this type of thing), in the late 60's. We have had this thing for about 30 years now, and it's darn near indestructible (it survived ME melting crayons on the vacuum tubes as a kid).

I will describe the radio.

It appears to be of a military origin, perhaps WW II or at least Korean war vintage, likely used by the British military because of the markings which I will describe in a bit. However there is no brand name to be found on it. It currently runs off 110v, but may have been adapted from 240v which is used in England.

It has a black metal casing with heavy pressed indentations (for rigidity in the sheet metal, probably). It's all vacuum tubes. It's 17" wide, 8" tall, and 10" deep. A big radio, and weighs about 30 pounds. There are handles on either side of the front panel to lift it. There are no rubber feet, but there are flush mounting holes on either side of the cabinet, as if it could be mounted in a rack. The front panel is held by 4 screws, and the entire unit can be pulled forward out of it's metal housing for repairs. No circuit boards, just tubes, RF chokes, big transformer, and plenty of coils, caps, and resistors underneath the chassis, soldered all over the place. All the tubes by the way are held in their sockets with spring-loaded fiber baskets (probably asbestos or fiberglass because of the heat). All the tubes look like they are wearing little white knitted wool berets. Cute.

Miraculously, this thing works, and works well. The tuning is off (i.e., WWV on 10Mhz dials in at 9.3Mhz), but it pulls pretty good.

Tuning is accomplished (analog of course) by an inverted-U shaped plastic dial where all the slide-rule type ticks and frequencies are printed (illuminated from above by 2 bulbs). The white pointer (moves behind the plastic dial) is operated by a rather nice, heavy crank flywheel tuning wheel, which can be locked in place by a little lever. The needle sweeps in an arc between the 9:00 to the 3:00 positions. A humorous note - the lock-lever simply wedges against the flywheel like a wheelchair brake. It's supposed to lock the tuner onto a frequency, but the pressure on the flywheel causes the thing to go out of tune because the tuning capacitor plates shift slightly due to the pressure on the whole shaft assembly by the lock mechanism. :-). Odd behavior for a radio that

is built like a steel vault.

It has 3 bands, controlled by a 3-way switch:

M.W.: (Medium-Wave, labelled in meters), from 200M to 550M. This roughly corresponds to the usual AM broadcast band (545 - 1500Khz).

S.W.1: Labelled in "M c/s" (Megacycles per second, i.e., Mhz), from about 2.3 Mhz to 7.5 Mhz.

S.W.2: Same as S.W.1., but from 7 Mhz to 23 Mhz.

On the dial, it gives you dots where BBC stations are supposed to be on the M.W. band, and on the two SW bands it labels individual meter sections for 120, 90, 60, 49, 41, 31, 25, 19, and 13 meter bands. For example, I pick up CW and the garbled SSB of the 80 meter ham band about halfway between the 90 and 60 meter marks (BTW, the unit is AM mode only, no CW or SSB).

More details:

Volume knob is labelled "GAIN". Two 1/4" plug jacks, labelled "2-1/2 ohm loudspeaker" (no, not AM stereo :-)). Knob labelled "AERIAL TRIMMER" (which inside is a variable air-gap capacitor, which seems to function as a sort of crude impedance matching device. It does work with my random length wire antenna at various freqs.). It is calibrated from "0" to "10".

There's a spring loaded "AERIAL" lug for bare wire, and two ground lugs at either side of the unit for bare wire. These lugs could probably be used to tie off an ore freighter they are so robust.

There's a "TONE" switch with "HIGH" and "LOW" positions.

There is a metal tag riveted on the front labelled "Mod Record" with numbers in little boxes from 1 to 25. There is another metal tag riveted on the front, which seems to have the most information on it:

RECEIVER BROADCAST
P.C.R. No. 3 Mk. 1/2
ZA 30607 SERIAL No. R/RAC/PE/ 377

There are no other identifying marks, and nothing at all on the chassis inside.

If anyone has heard of this type of shortwave radio, I'd love to know the history behind where and when it may have been used.

Not looking to sell, just looking to know.

Thanks much,

Mike

Based on my experience with my R-7000 and the TV module, it will not measure
up to what your average TV can do. It would be a waste of money if your
primary interest was to watch TV (noraml broadcast). As a matter of fact
I use my R-7000 several times a week and have not turned on the TV module in
2 years! I would be interested if there was a fix for this as Bradley asks.

The Garmin GPS-10 receiver board is less than $350 in quantities of 2 (two). It is an 8-channel
receiver with NMEA output. They can supply a program that runs on a PC and displays the data
from the GPS-10, connected to one of the serial ports. The above price includes the antenna.
One of the reasons that we like it is that is only consumes 1 watt (0.2A @ 5V). Garmin can be
reached at (800)800-1020. Note that this is not an endorsement, etc., etc.....

I had read in another thread that there have been two versions of the radio, the original, and then an update which was functionally the same, but had some differences according to the schematic. Does anyone know where the mod pot is located in case I need to adjust?

672. Yaesu FT416 vs. FT11

Newsgroup: rec.radio.amateur.equipment
Date: 1994-03-05 04:33:37 UTC
From: slama@ctron.com
Message-ID: <2l9231INN2q9@dur-news.ctron.com>
Source record: 227800

Hello,

Keeping this short...
I am considering purchasing either the FT416 or FT11 for use on
hiking trips.

It would be greatly appreciated if someone who is knowledgable about
these HTs could respond.

I am trying to decide which would suit my needs the most. Some points
that I would like input on are:

1. How is the "Advanced Track Tuning (ATT)" on the 416 an
advantage over the 11? When will its usefulness
become evident?

2. Ruggedness. Which of the two is more susceptible to
cold/shock (physical abuse)?

3. Does the FT-11 support CTCSS encode AND decode? DTMF?

4. Does the FT-11 have adjustable power output? This
is an important consideration for me, as I wish
to conserve as much power as possible on trips.
The 416 does, does the FT-11? If so, how many levels
of adjustment are there?

5. The FT-11 is *really* small. That is an advantage when space
is an issue. BUT, the difference in size between this
and the 416 is secondary when it comes down to
features. In other words, I am willing to sacrifice
size for functionality.

5. Overall. How does it "feel"?

Thanks!
Fred

Kevin- I would hate to have you make a terrible mistake like getting a FT-290rII instead of the fine TR-751. Its good you asked the net here.. The 290r is a very small and comprimised radio..if you really want small and can give up TX audio quality..and RX performance in every criteria, then the 290 is OK. Ive owned both..The 751 has a wonderfull clean transmitter- and the RX is rock stable and very hot with a GaAs Fet RF amp. The unit is one of Kenwoods real winners...unlike some other models. And the 290rII series is one of only a few Yaesu so-so radios. The 751 will cost you a few more bucks, but there is no compairison. Thats my two cents!

>plastic bags and factory boxes. Life went on. . . .
>
>After more than twenty-one years, those boxes are still unopened.

I then went on to ask for comments on the best way to re-introduce this equipment to the world in general and to power in particular. I received several very helpful responses (Thank You, everyone!) and one very interesting proposition.

One of the net members has offered to trade me his Kenwood TS-940S (with built-in antenna tuner) for the whole lot and he will take full responsibility for the electrical condition of my equipment. He says the TS-940S is worth $1250 on the current used equipment market. I am intrigued by his offer and, therefore, ask the following additional questions of the net:

IS a TS-940S w/ built-in antenna tuner (and CW filter) worth $1250?

What is the net's opinion of the TS-940S?

Would this trade be a good deal for me?

Thanks, as usual, for all your help. . . .

680. TM732A owners tip of the month

Newsgroup: rec.radio.amateur.equipment
Date: 1994-03-05 23:05:02 UTC
From: bmiller@landesk.intel.com
Message-ID: <2lb36u$gs5@ornews.intel.com>
Source record: 227808

I just thought I would pass this along to save others some grief.

I usually hop in my car, start the engine, push the power button on my
732A, and then hold down the memory button to start scanning the memories.
Well, once I did it a little too fast. I hit the power button and held down
the memory button before the unit had gone through its power-up sequence....

TOTAL RADIO RESET!!!!

Everything was gone form both bands. Now I make sure the -ON- display
clears from the screen before I hold down the memory button.

Just thought you might like fair warning.

681. PL scan on FT530?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-03-06 05:17:08 UTC
From: wy1z@netcom.com
Message-ID: <wy1zCM89CM.3Gr@netcom.com>
Source record: 227809

I've tried the instructions in the manual to active PL scan (F/M, SET,
F/M, T SET), but the HT didn't seem to care.

It has been modified for wide band receive (Pad 13 mod).

Funny thing though - the reference pages at the beginning of the manual
for the HT mention that the same keystrokes above have no affect on the HT.

What gives?

Thanks.

I might just include the right answer as a mod file to the World mod
archive files.

73,
Scott, WY1Z

From: bobw@col.hp.com
Message-ID: <2lcvqs$eid@hp-col.col.hp.com>
Source record: 227815

Karl Beckman (CSLE87) wrote:

: No, Bob, most commercial decoders are reliable down to the equivalent of
: 250 Hz deviation even at 6dB quieting levels; yes, they do have low-pass
: filters to avoid "talking off" from the actual voice deviation or noise.
: Amateur repeaters shouldn't require that kind of sensitivity unless the
: users have DX-contest-honed listening skills that will enable them to hear
: the voice clearly at 6dBq. Most repeater users or owners will not tolerate
: that noisy a signal being broadcast on their repeater, especially with
: their own callsign for ID.

I guess we must have an unusually large number of DX-contest
operators on our machines.... it seems that many people want
to push the limits of repeater coverage. :-)

: > all variations in the system. Isn't the real solution to always make
: > sure that the DTMF decoder is protected from CTCSS tones if such
: > tones are in use on a repeater?

: Yes, the PROPER way to do DTMF is directly from the discriminator through
: dual isolation amplifier/filter stages, one with a strong roll-off above
: 200 Hz for the CTCSS deck, and the other with a bandpass filter from 500
: to 1700 Hz just for the DTMF decoder. However, if you are in the market
: for a repeater controller, check the schematics and see how few amateur
: repeater controllers or patches actually DO include the filters. The
: manufacturers aparently assume that the repeater audio or discriminator
: output will be filtered, but that defeats the purpose of having the direct
: discriminator output in the first place!

For better or for worse, it seems that most (all?) repeater controllers
expect the repeater operator to deal with the whole CTCSS issue external
to the controller. The CTCSS decoder goes external, high pass filtering
to protect the DTMF decoder (and other devices) must be external.
Some controllers make a token effort at FM deemphasis.

I suppose that the reason for all of this is historical.
I'd prefer that the controllers handle all this internally, with
coupled-down-to-20-Hz audio in and out of the RF gear.

690. Opinions on IC-2SRA?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-03-07 18:06:08 UTC
From: keating@nosc.mil
Message-ID: <1994Mar7.180608.28455@nosc.mil>
Source record: 227818

Dave, I own a 2SRA. If you have specific questions please email me.
There are several good and bad things in general about this radio.

Good: Icom quality 2m radio, full features standard just as W2A has,
etc. Scanner has WFM mode. Radio has good audio, provided good
speaker and mic are used.

Bad: Scanner antenna is poor, and the connector is poorer. Print
wears off
the rubber buttons. Power is controled by a soft-switch rather than a
hardware switch. Mic attachment is non-standard and so is external
audio.
Battery attachment is not rugged enough to suit me.

Other comments certainly apply.
I have had mine for two years; no service and it works fine. I have no
intention of selling it, so I guess that tells you what I think of
mine.

Roger Keating - KD6EFQ

691. Icom IC22A Crystals?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-03-07 18:08:27 UTC
From: jim@shadow.scs.unr.edu
Message-ID: <1994Mar7.180827.27364@news.unr.edu>
Source record: 227819

I recently ordered 2 pairs of crystals to put my Icom IC22A on
2 local packet frequencies: 144.95 & 144.97. When the crystals
arrived and were installed, they gave operating frequencies of 144.93
& 144.95 respectively, 20 kHz below the desired frequencies. I called
Icom and verified that the formulas & crystal specifications used by the
crystal manufacturer were correct. The crystal frequency formulas are:

(1) T=Ftx/8

(2) R=(Frx-10.7)/9

where: T = transmist crystal frequency in MHz
R = receive crystal frequency in MHz
Ftx = transmitter operating frequency in MHz
Frx = receiver operating frequency in MHz

The crystal capacitance is specified as 20 pf for both R and T.

I even sent 2 pairs of orginal crystals (146.94 simplex
and 146.88/146.28) back to the crystal manufacturer for testing to
make sure that these crystal matched the orginal specifications, which
they did.

The only thing I can think of is that the crystal frequency formula (or the
radio!) is not linear down in the lower part of the band. To test this
idea I should have sent back for testing a 145.01 crystal pair that is
marked correctly and works just fine.

Can anyone offer any ideas regarding this problem? I considered just
keeping the 144.97 pair and using it on 144.95, and then ordering a 144.99
pair for use on 144.97, but I would like them to be marked accurately,
and in any case I would like to understand why the problem exists in the
first place. Thanks.

I've had my 732 since August, and I've done this twice now. I think Kenwood
made a big mistake in allowing a total wipeout of all memory by just pushing
one button, and that button is commonly used!

SOOOOOOOO, has anyone figured out to backup the radio using the clone mode?
I was hoping that one could save all the data through the mic cable
if it comes out in an RS-232 fashion by saving it in a PC or laptop.
Then the next time I reset the 732, I could just download the data
instead of punching 64 memory channels back in and trying to remember
how to set back all the differents modes I had.

>Gordon

I don't know about the BP-25 specifically, but most Kenwood packs I've seen
were glued together tightly -- there are no screws holding them together.
I have had success in softening the glue by warming Kenwood packs in a WARM
oven -- not at cooking temperature -- and being able to pry them apart with a
sharp knife. Replacing cells is then pretty straightforward.

>AM filter for the TS-50? Unfortunately, this radio
>uses a non-standard (for AM/SSB, at least) IF of 10.7 MHz.

Has anyone noticed the raspy sound of CW on the TS50....
conditions are in CW mode, CW filter installed but not
selected, and tuned to an offset of 1KHz or more. I don't
remember the raspy sound before I installed the filter, but
it shouldn't make any diff since I don't have it turned on.
If I tune around, I can get a pure sounding tone at a lower
offset....800 Hz maybe.....or maybe it comes and goes. It
sounds kind of like a square wave at times. This is mobile
w/ a bugcatcher style antenna.
Thanks......Chuck Hawley, KE9UW.

699. AM audio on Kenwood TS-430 (stinks!)

Newsgroup: rec.radio.amateur.equipment
Date: 1994-03-08 15:35:22 UTC
From: eesnyder@beagle
Message-ID: <2li5vq$4a7@lace.Colorado.EDU>
Source record: 227827

I recently bought a used Kenwood TS-430. I am pretty happy with it except for one problem. The audio when receiving AM signals (in AM mode) stinks. There is very little high end to the signal and it basically sounds like there is a pillow over the speaker. I can often make it sound better by tuning 1 kHz off the frequency (in either direction-- so I know it is centered properly) or even switch to one of the sideband modes (either will work so I know the signal I am listening to is not actually SSB). Does any one have and suggestions on to how to correct this problem?

Many thanks,

Try IRCI. They announced a few filters for the TS50. They advertise
regularly in the QST.

>Has anyone noticed the raspy sound of CW on the TS50....

I have the same set-up: TS50 and the Texas Bugcatcher. And I have
the filter installed. I have not noticed the raspy sound. But
then again, I almost always have the narrow filter on. I will check again.
I really like the radio. With the narrow filter selected, the audio signal
peaks nicely and makes it very easy to zero beat.

The only down side is that I have to leave the mic connected to
use the four programmable buttons on the mic. I have set them up
to change the power level, split reverse, sideband reverse for CW
and CW filter select.

In the last few days, I have been using it on 20m with just 10w out.
Never had to call more than twice to have a qso. Great fun.
Mobile qrp (almost).

>2 local packet frequencies: 144.95 & 144.97. When the crystals
>arrived and were installed, they gave operating frequencies of 144.93
>& 144.95 respectively, 20 kHz below the desired frequencies.

> (1) T=Ftx/8
> (2) R=(Frx-10.7)/9
>The crystal capacitance is specified as 20 pf for both R and T.

That is what is in the IC-22A manual. But the manual also states that
this radio covers either 144-146 *or* 146-148. It also says that "the
amount of frequency spread between any two receiving or any two transmitting
frequencies should not exceed 2 Mhz". I don't know exactly why it has
this limitation. I have had no trouble with crystals (I've added several
channels) but I have nothing below 146 Mhz.

--GaryM

P.S. Detailed specs for crystals are: HC-25/u, 0.0025% tolerance, 20pF load
cap, effective resistance: 15 ohms or less, cut: "AT" optimum angle +/- 2min.

: bob

The TS-60 receives from 40MHZ to 60MHZ and transmits from 50MHZ to
54MHZ.

It is a very nice 6 meter radio with 100 memories, CW, SSB, FM and
AM modes, 90 watts, excellant scanning capabilities and other nice
features.

It is expensive, however, about $999, last time I checked.

Email me if you want more info.

Regarding my posting about Motorola GPS receiver boards:

It seems to have generated a lot of email.

Please get information directly from Motorola's Position
and Navigation Systems Business division if you
are interested. Call (708)-480-8000 and then follow the
directions about calling (800)-4-ONCORE. No, I don't
know what they cost in unit quantities. No, I haven't
hooked one up to my ham station. No, I am not interested
in coordinating a group purchase. I'm just giving you a
pointer to further information. Thank you.

>cheers,
>Dan
>--

I use a "Miracle Baby" in and around Boston. I have no problem hitting repeaters that are on very high buildings (the Boston ARC, the New England Telephone ARC). I find that I can get into these repeaters from five to ten miles away. With other repeaters, it gives me marginal performance.

Most of my antennas, a stock ICOM, a Diamond RH77CA (5/8 wave whip), the miracle baby and a Cushcraft AR270 all pick up repeaters that I can't hit with my radio. I normally receive the Derry, NH repeater on my HT, but I can't hit it from Boston.

In a nutshell: the "Miracle Baby" is a good antenna for use in an urban area where you have good coverage repeaters. That's my $0.02.

While you're on the phone to Motorola the next time, ask them what a new radio costs. That ought to put the $100 programming charge into the proper perspective.

Speaking of $100, that will buy you just two type-N connectors for Andrew 1/2" heliax. Or just a tad less than that will secure you a 1200 mAH NiCad pack for your handheld.

>73's,
>Wayne
>WA2N / 5
>--
> wroth@netcom.com

I hate it! Had one on loan for two years, it's still better to have
a 757 than no TRX at all.

There is an internal interference at abt 14.080 that changes with the
1kHz digit of the display and also when switching the notch filter on
and off. I found out when i tried to copy a week RTTY station there.

I often change between wide and narrow filters. Going from CW-N to CW-W
requires to push the mode button *5* times.

My main interest is RTTY, AMTOR and FAX, feeding the AFSK tones to the
MIC socket. The 757GXII has a 600Hz CW filter and you need it on a
crowded band, but with this brain-damaged rig you can't use it in
LSB/USB mode, and in CW mode it ignores the MIC input.

When i started with AMTOR it didn't work with "nearby" stations. After
releasing PTT it took 52ms(!) until there was a signal at the RX output.
When it finally comes back the answer from the other station is already
gone.

For voice/CW it's probably ok. If you are interested in digital modes
then stay away from it. Also it can be easily modified for higher TX
output, especially on lower bands. A friend of mine reports 200+ watts
on 80/40m.

Source record: 227843
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I've accquired an Alliance rotor motor with no control box. The rotor
takes 5 wires, has the rotating mast thru the body and the mast top clamp
on the side of the case. I've been told this style is often used as an
altitude rotor on Satellite setups.
Questions:
1. What voltage does it take to turn the motor? AC or DC?
2. WHat are the pinouts for the five wires?
3. What is the model number or other ID's? (nothing on the case but Alliance).

I can open it up to get the pinouts, but I don't want to burn it out with
the wrong voltage etc.
I'm planning to use it to turn small VHF/UHF antennas.
Any positive responses are greatly appreciated!!!!!

Hello Catherine..Im Bob Nagy at UT Botany department..Here is how to
check low level mag fields. I manufactured an inepensive mag field
meter a few years ago..but could not sell them well...Ill tell you
how to make one. You take Radio shack's 30 dollar'ish analog audio DB meter
and remove the condenser mike element. You then take some 28 gauge wire,
50 feet of it..and make a small coil about 1.5 inches in diameter.
Take the two ends of that coil..strip and tim them..and solder them
to the two connections where the mic element was. Nothing else to do.
You can put the coil-sensor in a small plastic box and screw it to
the underside of the audio meter..That was my product..It seems that
calibration was un-nessasary and that a reading of -2 on the 60db
scale equated to the lower level that had been linked to damage in
the Denver studies. (anything above that) We have run many tests on
plant tissue here at a number of frequencies and show nothing
concrete. The word today is "prudent Avoidance" I still have a few of those
meters, and Id be glad to loan you one.

Toodles-
Bob

I have a Kenwood 742 configured with 220, 440, and 1200. I took out the 2 meter band module that originally came with it and sold it. Kenwood does not offer this radio in this configuration (in the U.S., anyway) but it works great! I have had absolutely no problems with this radio in a year and it has a lot of features. My only complaint is the microphone - the DTMF buttons are hard to push.

I also have an older Icom 901 that has also been a great radio. The only problem is that you can only monitor 2 bands at a time, but you can add a lot of band modules. However, the band modules are more expensive than Kenwood's. Icom says they cost more because of the fiber optic interface designed into the band modules. I know that fiber isn't cheap, so I tend to believe them.

A friend of mine who works at a local ham store has been using an Icom Delta-100 for a couple of months now. He really likes it a lot, as well as the Kenwood 742/942 series. His only complaints about the Icom are minor and he has no problem recommending it, either.

If I were buying all over again, I'd still get the Kenwood because I don't want 2 meters. But if I wanted 2 meters over 220 then I'd probably go with the Icom, but only because I know someone who works there, not because it's superior to the Kenwood.

Hope this helps!

John

>often make it sound better by tuning 1 kHz off the frequency (in
>either direction-- so I know it is centered properly) or even
>switch to one of the sideband modes (either will work so I know the
>signal I am listening to is not actually SSB). Does any one have
>and suggestions on to how to correct this problem?

Yes, put the YK88A optional 5khz AM filter into it.
It will be listenable then but not great. Buy a TS-850 and you can
enjoy a 12.5Khz slot for superb AM quality.
There is a mod for the 430 that I did to mine which lessens the high
frequency audio rolloff receive which will also help a little.
And of course You must use a large external speaker for good AM quality.
Its too bad that Kenwood prefers to nickle-and-dime us with options
that are really necessary.

I prefer my Hammarlund HQ-110 old tube receiver when I'm working
10 meter AM (gone but not forgotten). It totally blows away the
TS-430S in every respect for AM reception.

Look at what the cops are driving. Ford Crown Victorias seem popular
with them, as do Chevy Caprices. Order your's with the same fleet codes
that they use and you'll have a car that works well with radios. (It'll
also have the heavy duty electrical system, cooling system, and suspension
of a cop car.) Get the same color scheme that they use for their unmarked
cars too, that way the antennas won't draw suspicion. (And you may avoid
some tickets.)

How about a Suburban with a Diesel engine? Only interfering electronics
you should have to worry about is the alternator. And it has tons of
space for antennas.

And no emissions controls. :-(Diesel smoke is a suspension of carbon particles impregnated with the byproducts of combustion, which is small enough to enter your lungs and lodge in the lung walls. Once lodged all those combustion byproducts leach out into your body. Diesel vehicles need dust traps at the very least.

: yourself mags?

There was a letter to the editor in Oct 15, 1990 "Electronic Engineering Times" magazine that had some hints on do-it-yourself magnetic field meters. Basically, you make a big pickup coil and hook it to an oscilloscope or RMS voltmeter. The pickup coil responds more strongly to high frequencies than low, with a 6 dB/octave response curve. So, to get accurate results, you follow the loop with a 6 dB/octave low-pass filter (series resistor, shunt capacitor). You can wind the pickup loop yourself (e.g. 1350 turns 5 cm diameter delivers 1 mv in a 10-milligauss 60 Hz field -- the author used a 47K / 0.1 uF de-emphasis network which results in .4 mV for 10 milligauss.) Or you can simply use a dismembered C-frame 115V motor, disassembled power transformer, or bulk tape eraser.

To calibrate the pickup, make a one-turn loop of wire 11 inches in diameter and feed .223 amps AC through it. That results in a 10 milligauss field at the center of the loop. A more uniform field can be generated with a Helmholtz coil, with a bit more work.

: I don't want to get into a debate about whether such testing is
: worthwhile (at least not now).

OK, but just to put the whole EM field scare in perspective, the fields from CRT's typically measure in the few (single-digit) milligauss range, which is comparable to the stray 60 Hz fields you would find in the average home. The field directly under a high-tension power line is typically a few 10's of milligauss, which is comparable to the field close to your average electric stove burner. The earth's magnetic field is about 500 milligauss.

I got a variety of responses for a car which would be good for 100 watts or so of HF and 50 or so of 2 meter and 440 radio. Criteria were lack of interference from car into receiver and from transmitter into auto electronics.

Diesels and the Taurus were among those favored. Anyone else have comments on these choices.

Tnx agn Bob

To measure the AC magnetic field of a monitor make a large diameter wire loop. The voltage induced in the loop conductor is propotional to (number of turns) X (loop area) x (dB/dt). Output voltage is directly propotional to the AC magnetic field frequency.

TV and monitor screens have magnetic deflectors. They produce a high-freuquency field (around 15 - 30 kHz) which is easy to measure with a suitable AC voltmeter and the loop antenna. The frequency dependendence of the loop efficiency will cause the TV deflection fields to seem to have a magnitude of 300 times higher than a 60 Hz magnetic field with the same field amplitude.

A simple RC low-pass filter (integrator) will have an attenuation coefficient of 1/f and can be used to make the field sniffer frequency independent. Follow that with an opamp gain block and an opamp rectifier circuit and you have a simple "Directional Enviromental Magnetic Field Detector".

736. lojack detector wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1994-03-12 06:30:45 UTC
From: an19585@anon.penet.fi
Message-ID: <063311Z12031994@anon.penet.fi>
Source record: 227763

We have a possible situation with a small stick on transmitter
on one or more of our vehicles, similar to lojack but this
we understand is an older model, larger, requiring welding
etc....we are an environmental group who has also criticized
police misconduct.
We are in a large U.S. city. We are convinced, in our frequent
"chance" meetings with undercover types, etc. that there is
some sort of signalling device on at least one of our
vehicles. After some reading, though we are not technically
oriented, we have heard there are =very= small transmitters
made these days with an intermittent signal which could be
IR or some RF frequency, etc.
Is there any =inexpensive= equipment we could use to locate
such a device on an automobile?
Would it require driving to a remote area where there are
few other radio signals for interference?
please post or email directly.
thanks

I don't think you'll manage to get 5 floors out of the serial interface from the control head to the radio. The farthest you'll get is about 150 feet from the unit unless the signals are converted from RS-232 to RS-422, after that about 1500 feet is possible.

740. Wanted: Info on programming Wilson WH6016B

Newsgroup: rec.radio.amateur.equipment
Date: 1994-03-12 16:36:26 UTC
From: tim@umcc.umcc.umich.edu
Message-ID: <2lsr2a$fdm@umcc.umcc.umich.edu>
Source record: 227768
Cross-posted to: misc.wanted,rec.radio.amateur.equipment,rec.radio.amateur.misc

I have a couple of Wilson model WH-6016B VHF mobile radios that were
obtained by a law enforcement agency to be used by some of their detectives.

They'd like me to program these radios, so I'm tryingto track
down a service manual for this model, or at least a photocopy of any
relevent pages dealing with programming.

In the distant past, I have programmed similar radios, & know
that you need to pop the cover put the radio into program-mode by using a
jumper, & then using the keyboard to enter in things like channel #,
input/output freq, CTCSS, etc.

Does anyone out there have the manual for this radio, or know
how/where I could track down an inexpensive copy?

Thanks,

Tim

>Diesels and the Taurus were among those favored. Anyone else have comments
>on these choices.

People often say to buy a diesel because it won't generate any RFI. I wish they could have owned my diesel Nissan pickup. It had the most horrendous RFI I've ever experienced in a vehicle. There was a severe popping noise, similar to really severe ignition noise, any time the engine was running. I could disconnect the alternator belt and the battery (after starting the engine), and the noise was still there with no vehicle electrical equipment operating at all. It got into everything from the entertainment radio to HF, VHF, and UHF ham gear.

I tried every trick I know, (and I thought I knew them all), without any success. The dealer couldn't fix it. The zone office couldn't fix it. I even talked to factory engineers in Japan. Everyone was stumped. I finally sold the vehicle back to them and bought a Jeep pickup. Aside from some alternator whine, which I fixed with a choke, it's generated no RFI from it's 6 cylinder gasoline engine.

Well, if he's not going all around the building, just up. Five floors is
between 50 to 75 feet depending on building construction.

My question would be is he going up or down with the RF portion? Operating
from the roof with the antenna in the basement doesn't sound like it would
be the optimum situation.

Ignition noise is often NOT the problem. It is very possible that the
engine used fuel injection (solenoids, square wave pulses), an electronic
fuel pump (my Pathfinder has a noise problem from the fuel pump), and
a computer system. So getting a diesel is not likely to be a big help. Now
in the old days of mechanical fuel pumps, carbs, etc. it might have been
fine...

Thanks for your input on cars etc. so far.

I have narrowed my thinking to a small pickup or sport utility such as
Bronco, Trooper, etc., probably 86 to 91.

I am told that American cars have less solid state devices to go awry
due to RF from HF or VHF rigs, that Ford seems to be a good choice, that
Japanese vehicles may be more susceptible to RF.

Again, besides physical comfort (my back) criteria include lack of problems
from car to rig and vice versa, and other normal concerns.

All input welcomed. Thanks again. Bob

Thanks for several email responses on this question. We are
making some progress.
A few points. We are a research enviro group only, never
interested in property or other disobediance, but we have also
spoken out publicly on records of police surveillance and
harrassment of environmental groups, which is public record
at this point for anyone who cares to read.
As for the comment by Julian Massey, I see he is from the
LA area, and just for an example of police practices there...
what happened with the "elite" crime unit under Gates who
spent all the time and money spying on the private lives
of politicians, Hollywood actors, and the like, =merely=
because they had hinted at some odd criticism of the LAPD
at one time or another.
Perhaps Mr. Massey has stood up against whole police
departments himself and indeed found that remedies and
support are ample and sufficient.
On what planet?

To find out more about the anon service, send mail to help@anon.penet.fi.
Due to the double-blind, any mail replies to this message will be anonymized,

Hi,
I have already got a sorta French no-code license some weeks ago, and
am about to take the French code exam, so I began to search for a good,
fairly inexpensive and easy-to-use rig. I was thinking about the TS-50S or
the TS-140S, since I can cope to get some special prices from Kenwood.
Which one would you recommand me ? I undeerstand that the TS-50S is small but
has not a very easy interface, while the TS-140S is more bulky but maybe more
friendly also.
What about the performances of both rigs ? How do they compare from equivalent
stuff of other firms (Icom, Yaesu).

Thanks,
Vince (15 weeks and waiting).

Glad you asked. Despite the pompous noises made after the
departure of Gates, I have every indication that it still exists. But
who cares, the politicians are still corrupt, the actors are still a
law unto themselves and the judges won't put criminals in prison.

I have no reason to fear the police. I don't spend my time
whining and bitching. I get on with my life. If I don't like what the
cops do, I tell them. If I like what they do I tell them too.

>Perhaps Mr. Massey has stood up against whole police

The above paragraph is meaningless. It meant even less before
I made it a paragraph as the gutless wonder seems to have trouble
writing clearly. Perhaps paranoia does that to you.

Grow some balls and get out more often.

This was a *real* mechanical injection diesel engine. With *all* electrical systems disconnected, it still made the pseudo-ignition noise. The best guess we could come up with was that the plasma formed by combustion was somehow shock exciting something and causing it to radiate. We considered static discharges due to the rotating machinery, but we bonded *everything*, including finger stock on the crank and cam, and on the injection pump cam, and we put anti-static brushes on the clutch, all without making it go away. So I don't think that was it. It would sit there at idle in the shop and tear up every radio in the place with absolutely *no* electrical equipment operating on the vehicle. A real puzzle.

Well if it's a sport utility that you want, the Jeep Cherokee or Jeep Comanche pickup are hard to beat. The ride and bucket seats are *much* better than the Blazer (I've got a Blazer too, and the seats suck, plus it pitches a lot on rough roads.) or Bronco (another rough rider). My Jeep is electrically quiet except for a bit of alternator whine that I fixed with a choke, and the computer puts out a spur on 145.01 MHz. A couple of suppression capacitors and a bit of shielding fixed that. Mine is an 87 with 108,000 miles on it. My only expenses have been a bad oxygen sensor, a bad ignition sensor, and tires, gas, and oil. It's been a rock solid vehicle with a *great* ride for a 4x4.

I run radios in the Blazer too, and haven't had any serious electrical interference problems with it either. It's got 135,000 miles on it, and besides gas, oil, and tires, I've had to replace the shocks, water pump, and the entire HEI ignition. Not bad really. But the springs in the seats are shot (not that they were ever great) and it'll kill your back on a trip. The 94s have *much* better seats with good lumbar and lateral support. I've been eyeing them lately.

The company has some Broncos and Explorers. They've been radio hell. Noisy in-tank fuel pumps, ignition noise, alternator whine, gas *gauge* noise, injector noise, etc, etc, etc. We've pretty much tamed them, but it was a major job. If Ford built them the way they build police grade Crown Victorias, there would have been no problem. We've got several of them too, and they're dead quiet.

Gary

Ah, what to do. On one hand we have econazis, likely associated
with Earth First! terrorists, and on the other hand we have the
police, neo-fasicst pigs out to bust their chops, burn their churches,
and kill their wives and children. What to do.

Ok, there are simple and inexpensive ways of detecting, finding, and
disabling tracking transmitters attached to your vehicles, but I'm not
going to tell you how unless you identify yourselves and your affiliations.

Gary

It depends on what you are going to do with your radio....

If you are going to work SSB, then one of the loop antennas is probably a good bet. The other choice is to get one of the antennas from Diamond or Comet.

I have been using antennas from these companies for years. I have two 1.2 GHz repeaters and the Comet antennas have been in service on the mountains for years.

I especially like the 1218G for my repeaters. They are single section design and work great at 3600 feet. For home use, I like the Comet CX-903. It is a tri-band antenna (2M, 70cm, & 23cm). Feed it with low loss coax, either 9913 or hardline (I use 1/2 Andrew hardline at home, at the repeater sites, I use 7/8" Andrew hardline).

Well if it's a sport utility that you want, the Jeep Cherokee or Jeep Comanche pickup are hard to beat. . . .

Without commenting on their suitability for radio (and I know at least one person who has had a large HF station in a Jeep), in this part of the country (Northern New England) used Jeeps have been known as cars to avoid due to the amount of rust they develop. This is not an issue in the southwest, and I doubt they use much salt on the roads in the Atlanta area. Your mileage (sorry) may vary.

Another clue and balless wonder. Paranoid too. And what makes you think
that anyone gives a rats ass about you, what you think or where you are?

Another legend in their own mind....

Where are you posting from? What have you done to deserve this alleged
scrutiny? Have you ripped off the mob, threatened the president or shot
at the police? I doubt it. And if you think that because you support a
greener environment "they" are out to get you, you are beyond a doubt
clueless. Unless of course you're one of the eco-nazis that use the
environment as an excuse for senseless terrorism against corporations.

Yup, nothing like spouting a bunch of political rhetoric prior to
applying a lit match to the fuse.

Perhaps you're right. Perhaps they *are* out to get you. I hope they do.

My '94 Chevy Lumina Euro seems OK for HF; I'd planted my Kenwood
TS-140 on the passenger seat the other day, and had NO problems.
75W out on 20M thru the cigarette lighter; OK, large capacitor and
ferrite torroid on power lines, left over from my '88 Grand Am whose
"Driver Information Center" didn't like the 20M band :-). Couldn't
even find the "birdies" from the Engine Control Module's uP!

The only discernable "noise" is a small bit of hash from the fuel pump,
and a lot of hash when raising/lowering the power windows. I suspect
a simple LCL Pi filter on the fuel pump harness (near the fuel pump)
would take out the noise, but so does the noise blanker on the radio.

BTW:
Not to make this a big sale pitch for GM, but we do a LOT of RFI
testing on our cars to make sure that they neither corrupt nor get
corrupted by ham rigs. Stop by the GM booth at the Dayton HamVention
and we can talk some more . . .

^^^^^^^^^^
! WRONG !

We've been building diesel engine controllers for many many years.

In fact, we've got an engine controller for LP-fueled fork-lifts!

And we've got a controller for marine applications; one of them even
got submerged (with the boat) in salt-water for 10 weeks, and after
they dredged-out the boat (and cleaned-up the engine) the engine
started on the 1st-crank with THAT controller. But I digress.

There are several diesel models with computers controlling the
electronically controlled transmissions!

And what about the instrument cluster, CD player/Radio, etc.?

Anyone have experience running a rotator with a power inverter?

The specific question is will one of the smaller rotors work with the
$100/200W units? Primary interest is use a backup power supply (marine
battery) for emergency services. I know that some of the cheaper
inverters only put out square waves. Does this cause a problem?

Thanks in advance.

How about telling a story...

When I was in college I worked at an electronics surplus place in Berkeley, CA (where paranoia thrives). Got a call one day from a woman who said she thought she found a bug (radio type) on her windowsill and if she brought it in could I look at it. Sure, bring it on in, I told her. An hour later she arrives, carefully unfolds a wad of toilet paper, and shows me...a tiny glass sliver! I'm talking 3mm tops, clear glass. On a windowsill, of all places. When I told her I didn't think it was a bug she gave me a look that said "you too?" and left. What a town!

73,

Hi,

Need recommendation for a small TX amp kit which takes about 4 watts output from my QRP rig and puts out 20-30 watts with
built in T-R switching (preferably solid-state T-R) and runs off 12-13.8v DC power supply. Must be small so I can fit it into my
existing rig's casing. Should be something similar to the QAMP-20 from Ramsey Hobby kits. BTW, this is for 20 meters. Tks.

73,
Daniel

Changes: new mailing lists, .packet rmgroup, and .policy updates

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info,
and rec.radio.swap newsgroups. It is intended to serve as a guide for the new
reader on what to find where. Questions and comments may be directed to the
author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 18 September
1993 to add the mailing lists for the new rec.radio.amateur newsgroups, to
note the rmgroup of rec.radio.amateur.packet, and to officially retire some
(in)famous threads of discussion on rec.radio.amateur.policy.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began
to dominate other topics in the group and on the list. This resulted in the
logical solution: a group was created to hold the packet discussion, and
another corresponding mailing list was created as well: net.ham-radio.packet
and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great
Renaming essentially unchanged, moving from net.ham-radio[.packet] to
rec.ham-radio[.packet]. Readership and volume grew with the rest of the
network.

The INFO-HAMS mailing list was originally run from a US Army computer at
White Sands Missile Range, SIMTEL20. There were few problems with this
arrangement, but one was that the system was not supposed to be used for
commercial purposes. Since one of hams' favorite pastimes is swapping
gear, it was natural for hams to post messages about equipment for sale
to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use
restriction, and after some argument, a group was created specifically
```

for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize

this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, should be removed by September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas,

commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

jangus@skyld.grendel.com (Jeffrey D. Angus) writes:

> Perhaps you're right. Perhaps they *are* out to get you. I hope they do.

Well, at very least, _you_ seem to be out to get him, or at least,
you message carried some rather nasty overtones that I doubt reflect
the way you'd really like us all to think of you -- or the way I
imagine you'd like people to think of hams.

People have all sorts of reasons for wanting anonymity. You don't
even know if this message was from here in the U.S., and certainly
I'd guess you'll concede that even if our government plays by the
rules most of time, there are occasionally some spectacular lapses, and
if you look outside the US, often, anything goes.

Seems to me that if you're unable or unwilling to offer the assistance
requested, that simply ignoring the request would be sufficient. Or
if you'd be willing to help, but only under certain conditions (e.g.,
that the group requesting assistance disclose in private email the
necessary facts to satisfy you) then say so and be done with it.

I don't see a real need to be nasty and I'm sure, on reflection, you'll
agree. I just don't believe this post reflects your true attitudes.
You're a nicer guy than that, I think.

I have a Yaesu FT-5100 that I have had for a couple of months.
After going through a couple of SWR/PWR meters that I thought were
defective, I am beginning to think there might actually be a problem
with my radio.

Using a couple of different meters, I consistently measure very low
power-- maybe 200 mW when it should be putting out 50 W. I find it
difficult to believe that is all the power the unit is putting out
(on 2 m) but that's what the meter says. No one complains about my
audio quality and my PC screen even cants a little when I key the
mike on high power. However, the reading remains. The only thing
I could have possibly done to the radio is key the mike without the
antenna attached-- this is bad, I'm sure, but would it necessarily
be fatal? Could I still be putting out a signal with reduced power
or would the failure be catastrophic?

Now I ask, is there any way that I could screw up using the SWR
meter? I mean it's not Big Science.

Suggestions?

Thanks,

Hello Eric..Bob Nagy at UT Botany here..
Well, indeed there is a failure mode where you would be putting
out a couple hundred mills. First thing to test is if your power
supply is delivering 10 amps or more on full power xmit. Then,
get someones known working power meter and cables. You could also
do a de-facto test and A-B the mobile against an HT connected into the
same antenna..running at low power. Compare your quieting into the
repeater with different power settings on the HT and match it to the
quieting on the mobil.
If you do find out that you are generating 200MW, there is a great
chance that your modular power amp in the Yaesu is fried.

Have at it.

^^^^^^
Well, there you have it! I was beginning to worry that my $4 HRO cable might not actually be connecting my $600 radio to my $100 SWR meter so I thought I'd check it. Hmmm... center conductor seems fine... Hmmm, that's interesting, the center conductor and the shielding are connected! Good, no wonder the meter wasn't registering anything, I was dumping 50 Watts into the damn cable! Well, gotta hand it to Yaesu for building a radio that can stand up to that with apparently no ill effects.

This little incident also bears on a question someone had about the Radio Shack VHF SWR meters. I gave them a lashing after returning two of them as faulty (using the same cable, of course!)... So I would bet they worked after all. I feel a little bad about that but I'm sure RS will recover.

As many on this newsgroup know, I'm a big TS-850 fan and have owned
more than one - my first being one of the first to arrive into the
local store.

Last weekend, at Phoenix's largest annual swap meet, I saw about
three or four TS-850's for sale, all for around $1250.00 each.

But, I didn't see any FT-990's for sale... Hmmmmm.

I still like my 850, but lot'sa folks really like the 990.

Most of the reviews I've read, including the one in the PASSPORT TO WORLD BAND RADIO, agree that the R71A is much better than the R72. The filters are not as good on the R72, and there are better radios than it in its price range. I've never used the R71A, but have the precurser, the R70, which doesn't have the direct entry keypad or computer control. It's a wonderful receiver, I have no complaints at all about it, and plan on using it in tandem with the TS-830 transceiver I'm planning on getting.

Vince, you are jumping in the deep end !

Could I suggest that you do not buy an expensive radio until after you have gained some experience with a cheap one, formed your own opinions, and found out what your interests are likely to be.

I advise buying an old but functioning radio as a learning exercise. These things have done most of their depreciation, so when you have found what you hate and what you like about it, you can sell it and get almost all of your money back allowing you to go out and buy a radio that will accurately fit your needs.

The TS50 is an interesting radio. It has been carefully optimised for use in modern cars, and the controls seem well designed to make mobile use much easier than with anything else. BUT a number of sacrifices were made to fit it in that small box. This radio is OK used with typically inefficient mobile antennae, but suffers overload if used with the kinds of antennae that you would likely erect at home. These radios are new on the market, have excited many people and so fetch very high prices new. You would suffer a lot of financial loss if you bought one and then decided to change.

Different people may be enthusiasts for different brands and may absolutely hate others, but look at the IC735 which has got a reputation for good performance and also the FT890, FT990. No manufacturer is perfect, all have produced radios that proved to be junk.

The TS140, TS680, and TS440 that I've had on the spectrum analyser in my shack were not as clean on transmit as I would like, I think one of the mixers in the TX path is run at too high a level in order to economise on amplifiers later in the path.

Hope this helps a little,

Bon chance

Yes, but at a mere 18,000 pounds not many can afford such a car. Practically, I found the Cavallier reasonable RF quiet. Fiat Uno, too noisy. Diesels are definately better, they have a bigger battery too.

I have had a TS-50s for about 9 months now. I have the cw filter (does anyone even transmit on SSB? :-)) in it.

I guess I must have a different rig that most of you out there, because I've never experienced anything but excellent audio on this rig (although I do use an external Motorola mobile speaker. The audio in AM mode is better than I've experienced in a vast number of radios, and I might go as far as to say the best I've heard on an amateur radio. The CW performance is very good, and although not as good as my Signal/1, it's equal to or better than a lot of rigs.

So far, I've compared it to a Yaesu FT-707, FT-310, FR-101, Drake TR4CW, TR4C w/Sherwood mods, TR-7, Signal/1. While not an exhaustive list, these radios are good performers.

Bill

PS I don't do ICOM.

From: glagowsk@eecs.wsu.edu
Message-ID: <1994Mar18.101919.22663@serval.net.wsu.edu>
Source record: 227733

I am using my ICOM 765 for USAF MARS operation on frequencies in the
2.6 mhz, 3.0 mhz, 4.5 mhz, 7.5 mhz, and other frequencies out of the
way from the usual amateur bands... Above 10mhz it works quite well
on ANY frequency.... but below that it is "dumb" and doesn't converge
on a good setting, even with a 50ohm dummy load.... I therefore
resort to disabling the built in ATU and use an external one...

Has anyone discovered how to make the IC-765 internal ATU more "intelligent"
with regard to operating on general coverage frequencies below 10 mhz?????

806. VHF rig in a Toyota. Update.

Newsgroup: rec.radio.amateur.equipment
Date: 1994-03-18 13:59:11 UTC
From: kevin jessup <kevin.jessup@mixcom.mixcom.com>
Message-ID: <1994Mar18.135911.17793@mixcom.mixcom.com>
Source record: 227734

I previously asked about installing a 50 Watt 2-meter/70cm rig in
a Toyota or Honda. I received a couple of horror stories saying
not to try it as the ECU will most likely be damaged.

I wrote to Toyota and received and amateur radio application note
that was not very encouraging.

Well I got sick of connecting antennas, power supplies and speaker mikes
to my HT every time I got in and out of the car so I installed a
Yaesu FT2400H 50 Watt 2-meter mobile rig in my 1991 Toyota Tercel (bottom
of the line) car. I started the car and and started transmitting at
5 watts while listening for any change in engine perfomance such
as funny noises or rough idling. I then went to 25 and 50 Watts
and had no problems. Hopefully, things will continue that way. No
funny dashboard electronics or problems with the stereo either.

In the Tercel, the engine computer is mounted dead center of the
dashboard just behind and below the radio. I mounted the Yaesu
under the passenger side dash (almost eliminating what little
leg room there was) about 8 inches to the right of the ECU.

I ran 14 guage wire for the power supply directly to the battery
by poking the wire through the wide grommet used for the air
conditioning condensor drain.

The antenna is a Comet dual bander on a trunk lip mount using
the Comet low-loss coax.

The Honda is next.

Regardless of my results, Toyota owners should proceede at their
own risk!

Good luck and 73!

Unless you buy them used, $89 is rock bottom. I would suggest getting one
with a full frequency display. The model with only two digits gets very
annoying. Also, dont get one with less than 20 channels or you will outgrow
it too quickly. Scanner quality from $89 to $200 doesn't change much. They
all do the job reasonably well. You are mostly paying for the features.

There are no frequency expanding mods for this radio. Its excellent RF performance is mostly due to the fact that the RF circuits were designed for Ham band only.

A good HT is one that can withstand a 6 foot drop on concrete *repeatedly* without harm. A good HT is one that will operate reliably for years in a filthy, high vibration environment. A good HT is one that *always* has a clean output, or no output, regardless of battery condition. A good HT will operate in a high RF area without intermod or overloading. A good HT is one that's fundamentally intuitive to operate. In other words, a good HT is a GE Mastr, or Motorola HT220. All others are varying degrees of *bad* HT. (Though an Icom IC2AT comes close to being a good HT.)

^^^^^^^^^^

I don't think one should pick a radio just on looks. I have an 850S-AT with the optional 1.8 SSB filter and enjoy a lot of low band work (160 and 75m) I tried a friend's Yeasu 890AT for two weeks, side by side, using a Daiwa switch in reverse and did a lot of *listening* (as opposed to *seeing*) switching rapidly from one radio to the next. The Kenwood 850 is a lot "noisier", i.e., the human voice is not clearly separated from the background noise, unless you cut back considerably on the RF gain. With the Yeasu, it is seldom necessary to play with the RF gain.

A friend has both the Yeasu 757 and a Kenwood 440AT and he confirms the same findings. The Yeasu is more pleasant to listen to and most of us do a lot more listening than talking. My next rig is likely to be a Yeasu.

The above impression is about SSB reception only. I have not tried anything else really. To be fair, the 850SAT is a little better at avoiding strong QRM, but in practice this was not very important, through the 2 weeks I tried both rigs. The 850SAT is also a quicker rig to utilize and its tuner is faster. My 2 year-old rig has not had a single problem since I bought it new.

I have an FT-990 that I bought about 2 months ago after a *lot* of
time spent soliciting opinions, reading reviews (if you're thinking
of buying a radio and haven't yet bought the two volumes of collected
QST reviews that the ARRL offers, you should!), and sitting in front
of the units I was considering at the local Ham Radio Outlet.

I'm _very_ pleased with the 990. I haven't tried transmitting anything
yet (I just took and passed my Novice, Tech, General and Advanced tests
about 5 weeks ago and am still waiting for my ticket) but have spent
a lot of time listening. I'll confirm that the the 990 is a very
pleasant radio to listen to. On CW, it's terrific. The built-in
audio filters allow you to zero right in on a signal.

Daniel, if you stumble upon a small CB ampflier, you might try using it
with your 20 meter QRP rig. Many of these amps are very broad banded, if
sometimes somwhat dirty. I know of a local ham who sometimes steps up
his 5 watt Ten Tec rig to about 50 watts on 40 meters, using a CB amp.

Well, get the SERVICE manual, and hope that they haven't obfuscated
how it works...

Alternatively, call Stone Mountqain Engineering and get a "QSY'er", a
neato little box that plugs into the rig and allows for keypad
frequency entry...

Rolling your own for this may be far more frustrating than it's worth.
And, you have to keep all the computer has out of the rig. ;^)

Owners or users of Icom IC-u2AT HT's please help me . . .

Questions:

1. The IC-u2AT comes with a BP-22 battery. I am trying to estimate
the condition of my BP-22 battery. When fully charged, the
output voltage is 6.8 volts. Does your BP-22 show a similar
output voltage?

2. I am planning to buy the AD-11 adapter from Icom that allows
the BP-3, BP-5, etc. size batteries (which were originally
designed for use with the IC-2AT, 3AT, 4AT) to be attached to
the IC-u2AT. I would then get "clone" battery packs from
other battery manufactures. (It appears that none of the
independent battery suppliers sell battery packs that are
clones of the BP-22, BP-23, etc. any longer.) However, I need
to know the voltage that the BP-xx packs put out so that
I can determine which of the BP-x packs can be used. Can
you please help me with this?

Please reply by posting to this newsgroup or by mail to
wilen@vnet.ibm.com, whichever you prefer.

Any help is sincerely appreciated.

Louis Wilen N5FFN

Unless stated otherwise, the opinions expressed are my own.

821. IC02AT "reverse" question

Newsgroup: rec.radio.amateur.equipment
Date: 1994-03-20 19:06:38 UTC
From: jgates@hebron.connected.com
Message-ID: <jgates.764190171@connected.com>
Source record: 227648

One can punch "reverse" and listen to the input of a repeater if you are in the "dial" rather then "memory recall" mode.

It would be nice to use this "reverse" feature from the "memory recall" mode - does anyone know a way of doing it OR writing the memory info back into the display easily so you can then press "reverse" ?

Would appreciate email replies rather than posted ones.....Thanks

John

I've lost the information sheets on my MFJ 941D "Versa Tuner II". I want to connect a longwire antenna, and I see that there is a line drawn on the back between the terminals for the longwire and the left of the two terminals for the balanced line. Does this mean I should short these terminals when connecting a longwire?

Thanks

Has anyone heard/seen anything concerning the Patriot Communications Technology PC-1610, other than the advertisement in the March CQ magazine?

It is a HF transceiver with keyboard interface (std IBM AT keyboard) and built in CW, BAUDOT, and ASCII in addition to SSB. 75W out, built in iambic keyer, 4 bandwidths, 3 selectable antennas, $995 introductory price.

Looks like there is no built-in AC supply.

: Come on, don't you really understand, that "seeing" in the
: context meant they tested it in all the modes they wanted?

: If it was a joke - I apologize.

: (:-).

Hmm this takes me back a couple of years, the first TS850 I saw was
on a stand at a rally. There was a large crowd around it, fighting to
spin its knobs and poke its buttons. It seemed rather futile, really, as
none of the stands had any electrical power, and the set was
consequently unpowered. They must have really liked the feel of those
knobs because some people were offering to buy it there and then,
untried. One individual in my hearing offered the stall holder a premium
over the list price just to get that one, said to be the first in the
area. To fully understand the meaning of this, readers in the US must
note that in the UK, list price is strictly selling price, although you
might get them to throw in an accessory worth a few percent of the deal.
UK list price is about double the US prices seen in QST.

I was somewhat stunned by this, and have watched for the effect
recurring, which it did at another rally when the TS50 showed up.

I have witnessed people buying radios by appearance !

I just can't decide whether it is a joke or not, although P T Barnum
would have found it funny....

Cheers

831. Strange Amplifier Interaction

Newsgroup: rec.radio.amateur.equipment
Date: 1994-03-21 13:31:34 UTC
From: w1gd@cbnewsj.cb.att.com
Message-ID: <Cn0o8q.2FB@cbnewsj.cb.att.com>
Source record: 227656

My neighbor, NC1A, was checking the SWR on his vertical antenna and noticed a strange interaction with his linear amplifier (a Kenwood TL-922). The amplifier was turned off, yet he noticed that moving the variable caps (I don't know if it was the "tuning" or "loading" controls) on the amplifier output circuit changed the output power from his xcvr. This only happens on 15 meters. There was no change in SWR. I haven't looked at the schematic for the TL-922, but I presume that the amplifier's antenna relay completely removes the pi-network with the power off. (It does on by SB-220.) Any ideas on what's happening?

: Yes, but at a mere 18,000 pounds not many can afford such a car. Practically, I
: found the Cavallier reasonable RF quiet. Fiat Uno, too noisy. Diesels are
: definately better, they have a bigger battery too.

: Mike

18,000 ho ho, you've been reading the brochures ! Just decide on a
few creature comforts, a radio other than the one that comes standard
(unbelievably nasty) and you are talking a lot more dosh still. I managed
to resist the temptation of the central heating boiler and freezer, but
occasionally wonder about adding a winch. The headlamps are a bit
lacking (remember Spike Milligan's landladies' light-bulb jokes?) so a
pair of decent lamps is essential, and the lamp bracket needed is #200+
bull-bar shaped... these things are not much diffeerent to range-rover
prices when you get to decent levels of equipment...

With a heavy trailer behind and a pair of large horses, it's true
class shows.

The local RIS man has been given a Discovery with a pneumatic mast
through the roof. He's as happy as the proverbial dog with 2 tails.
they've bolted a 240v generator where the airconditioner pump would go.

Note for US readers, see lower photo on Feb QST cover to see one of
these vehicles out for a little fun....

Cheers
David

833. Kenwood AT-250 and TS-440S - Question

: Thanks
: --Rob

I went through about the same process a few years ago.

I wind up fixing an awful lot of radios for various locals, so I've had most things apart and on a decent spectrum analyser and intermod test setup on my shack bench.

To phrase it diplomatically, improving on your 440 should not be difficult at all.

If you don't want general coverage receive, a modified old tenn-tec Corsair is a possible low cost route, an OmniVI is a high-cost one.

The FT1000 and its offspring, the FT990, have slightly better front-end intermod performance than the IC765, but the filters in the 765 are more artfully designed for clear sound rather than for impressively sharp plots. For this reason I chose the 765, and still think it was the right decision. The 765 speech processor is one of the very best, unsolicited compliments on speech quality are usual, even with the processor running. This is a very smooth and effortless performer, Power supply and PA heatsinking are adequate to cause no worries on prolonged ragchews at full steam ahead with max processing etc.

Bad points of the 765:

QSK excellent for japanese, but still not as smooth as a ten-tec.

Auto ATU cannot be frozen at a compromise, sometimes it just keeps hunting and won't allow reduced power into 1.5 to 2:1 VSWR. a nuisance.

Controls a bit scattered, but you get used to them, then they're OK.

The 765 is overpriced

****

Synopsis:

If someone offered an FT1000 in exchange for my 765, I'd refuse
politely, after a moment's thought.

An FT990 I'd treat the same as an FT1000

A TS 950.... (any version), No pause for thought, a fast rejection.

An IC781... I'd just collapse laughing.

A Paragon... more laughter

An Omni VI ... might just tempt me, after a careful trial, but
ten tec would have to inprove their mechanical quality.. especially the
rate of wear on the bearings of their main tuning shaft encoder.

The 765 is 13.8v internally, so if necessary, you can open the case
and wire in a car supply, but operation iss likely to be impaired at
12v.

Just personal opinions, biasses and ramblings. I hope they help

From: harland@sabre.mech.ubc.ca
Message-ID: <2ml0k0$3b4@nntp.ucs.ubc.ca>
Source record: 227665

I am thinking about buying a 2m HT. I have read the glossy ads,
in CQ and 73 but I can not come to any conclusions.

Which do you use ? What are its good / bad points ?

Is power important or is battery life more critical ?

What features are important DTMF, CTCSS, pageing, ...

I am looking at models from Kenwood, Yeasu, and I-COM. I am
leaning toward the Kenwood TH-28A. I am also looking at the
Yeasu F-11R and 411 as well as a few models from I-COM.

I would appreciated any recomendations or info on these or
other 2m HTs before I take the plunge and buy one.

I do plan on carring it with me once and a while but moslty I
will use it in my car on at home.

Thanks,
Harland

There are none. This radio was designed with a tight front end that only will pass the 2M band. Makes for good intermod performance. Wide open front ends pay a penalty: intermod problems.

Rob..I am going to have to suggest the TS-850..without antenna tuner.
That should be about 1500.00
There is just no radio that stacks up to it at that exact price range.

And has anyone but me had problems with those noisy-high distortion
Audio output amps in the ICOM xcvrs? My hearing is real good in the
upper freqs..(ie 16K) and the odd harmonic distortion in that range gives
me real bad listiner fatigue in short order. The IC-751a series is
real bad about it..

Referring to the choice between a Yaesu FT990 and a Kenwood TS850:

: A friend has both the Yeasu 757 and a Kenwood 440AT and he confirms
: the same findings. The Yeasu is more pleasant to listen to and most
: of us do a lot more listening than talking. My next rig is likely to
: be a Yeasu.

This seems to be a popular pair of radios. There've been several postings over the last months asking for comparisons between these rigs. I've also narrowed my choices down to these two if (when?) I ever replace my Drake rigs. One thing that almost never seems to get mentioned however...

How do these rigs sound on the air! At the risk of starting a flame war, I'll venture the opinion that, in general, I find Kenwoods putting out among the best sounding signals on the air. I've got to admit that I enjoy hearing the reports of superior audio quality that my Drakes seem to get on sideband, and I'd hate to give that up. I like putting out a good pleasing signal! If it weren't for that factor, I'd probably lean towards the Yaesu. As it is, I'm not sure.

Any thoughts or comments on the transmitting audio qualities of the major brands on sideband, particularly these two radios?

As far as power vs. battery life, it all depends on how you intend to use it. If you're mainly going to be accessing local repeaters, then a lot of power is not too important. If you're going to be doing a lot of simplex operation, especially with distances involved, you want to be able to run more power. I suggest that you make sure you get a second battery pack, so that you can use one while charging the other. If you want to spend around $100, you can get a 1 hour quick charge unit. Also, for mobile operation, you can get an car adapter to plug it into the lighter, thereby giving you full power (most battery packs that come with HT's don't put out the full 5 watts, usually only around 2.5. You have to buy an extra, larger battery pack for the full watts output).

As far as features, you'll want CTCSS, so that you can access repeaters that require pl tones (important in crowded areas, or for closed repeaters). DTMF is important if you want to use autopatches. l consider those two the minimum requirements to get. Other nice touches are battery saver features, paging, pl tone scanning and stuff like that.

I have a Yaesu FT-530 (it's a 2 band, 2m and 70cm) and love it, especially the pl tone scanning feature. I'm not up on single band units. A previous reply to you mentioned intermod problems in large cities. I have heard that the Radio Shack 202 model is very good about not having intermod problems, since it is designed as ham band only. The drawback is you can't modify it to work as a scanner, it's a little bigger than most new HT's, not as many features, and many people are prejudiced against Radio Shack products. However, I have found several people on here and on Genie who are quite pleased with theirs.

I wonder how well the vertical is grounded. Even better yet, is it roof mounted?
Since the TL922 uses a standard PI output network (the tune and load caps are in shunt), it could be that the grounding path is --> along outside of coax, to amp, thru tune/load cap, then to chassis ground and finally earth.
The frequency selective effect would kinda hint that the transmission line is a part of the return circuit.
If the vertical is BONDED to earth....then ignore me completely, I don't know what I'm talking about ;-)

I have a Kenwood TH-27A and a friend with the TH-28A. I am very happy with the "features" on either radio. On the other hand, the biggest problem I find in our area (Denver, CO) is that the TH-28A seems to have way too wide a front end in the high intermod areas. When I get downtown with my TH-27A, I fight intermod, the TH-28A and my wifes TH-78A (dual band) get almost intolerable. This will be a problem with almost any hand held. The new Kenwood models are supposed to be better on power than the TH-28A but I have not had to chance to try one.

Source record: 227676
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

It seems that the SSB quality depends on 3 factors:
1. Passband characteristics of the AF chain (including the microphone),
2. IMD of the PA,
3. Type of processing, audio or RF?

I am wondering why the QST reviews do not mention the type of processing, which has a large effect on signal quality. Signals with audio processing have higher content of AF harmonics, and are subsequently less efficient (3db?) and more difficult to tune. All cheaper rigs such as IC 725-737, FT 747-757, TS 430-450 use AF processing. IC 751-, FT990-, TS 830- use RF processing. I am not sure about the rest.

Harland:

We live about 30 miles south of Salt Lake City, and have many repeaters adorning the mountain tops all around. We have found that power is not greatly significant unless you are in a poor location. MOst of the time we use 2.5 watts, but have the capability for 5W. DTMF - a resounding yes for the occasional auto patch, especially for emergencies and 911 service. We don't use CTCSS/paging, but it would be a nice feature if my wife ever decided to get her license. Battery life is not critical as long as you have a second battery. We have a couple of 7 amp hour gell cells that we can plug in for longer term operation like going camping. I had a 28A and found it susceptible to intermod, even in my distant location from the big city. It had some great features: I especially liked the clock radio feature that would turn it on at the time I preset, so my commute group would wake me up and get me going <HI>! We have ended up with three Alinco DJ-180T/H. They are not fancy, but do the job very well (3 hams in our family). I bought two of them with the 12 volt battery, and mine has the 7.2V battery. They have DTMF, scan, and memories, as well as out of ham band receive, but no real "frills". I am currently using mine on my packet station until I convert over to a mobil unit.

Another recommendation is the Yaesu FT-530 dual band. It is a great radio. My son's friend just bought one after involving us in their search, and it really works well. My son is saving up for one (in fact he wants to sell some of my equipment to get some money - cheeky 13 yr olds!).

Good luck,
Milt

Hey everyone, I am looking for some information on how to retune the channel elements for GE Master II radios. (I guess these channel elements are also referred to as "ICOMs" i.e. they have the word ICOM written on top of them, anybody who is familiar with these knows what I am talking about.) Anyway, I want to order crystals for these things and retune them myself, rather than sending the channel elements in to be recrystalled for me. (I am hoping to save some money.....) I am hoping that someone out there can fill me a little bit more on how these things are tuned. I know that there are several small parallel lines on the back of the circuit board that are supposed to be used for varying the capacitance, but am not sure of exactly how to go about this. I don't want to have to cut and resolder one by one to see what happens... Looking inside the units that I have, none of these lines have been cut, they are all connected... Anyway, any help would be appreciated!!!

Thanks in advance! - JON

859. Batteries for HTX-202

Newsgroup: rec.radio.amateur.equipment
Date: 1994-03-23 14:52:00 UTC
From: HICKS.ALAN@epamail.epa.GOV
Message-ID: <01HAB452JAEE8X1S3Z@mr.rtpnc.epa.gov>
Source record: 227687

Bob, VE7EMD asked about batteries for the HTX-202 2-meter handheld from Radio Shack.

I have had luck with ICOM BP-5 (drop-in charge, 500 mAH, 10.8V) batteries like those used for the IC-2AT.

I have also successfully used the DELCOM pack available from TNR and other battery suppliers. This is another IC@AT-compatible battery pack that holds 8 standard ni-cd AA cells and has a built-in charger/regulator like the ICOM BP-2 and BP-3 batteries, so you can charge it directly from a 12-14Volt power supply or an automobile lighter socket. It's a bit more fragile than the ICOM packs, but the price is right !

Good luck es 73 de KD1DJ.

Certainly true about the voice characteristics, but when a rig
changes locations and starts getting poor audio complaints,
one might want to be sure there is no "RF in the mike" syndrome
present. Major RF levels will be obvious, but low levels
might not. SSB is especially sneaky since the distortion
only occurs on voice peaks, not the whole signal.

I would also look at Standard. I have a Standard C168A (my wife does also). It is currently selling for I think around $290. They also have some new models out, a C158A I think it is that is around $250.00 and a C178A which is primarily a 2 meter rig but has 70cm but only with 100mW output on 70cm. I called HRO and they quoted me something like $399 for this one.

From my own experience and that of other Standard owners I have talked to we seem to have less intermod problems with our radios than Kenwood etc. and it also seems that our operating time between battery charges is better from what I read on the net. The C168A is loaded with all the features, half of it stuff most of us will never use, and Standard makes a really quality product and backs it up with excellent service. The only thing I don't like about my C168A is that the keypad is not lighted and there have been a few times that a lighted keypad would have been nice.

On the flip side the Kenwood TH28 would have been my second choice and I have heard good reports on it. There are alot of nice 2 meter HT's on the market and it makes the buying decision that much more complex.

If you are looking primarily for something for car or home use I would seriously consider a mobile rig instead of an HT. Then again that depends on how far you are from repeaters you intead to use etc. It doesn't take much of a hill for example to render your 2.5 watts from an HT pretty useless. On the other hand a good antenna will make a big difference over the rubber duck antenna.

Good Luck

862. Need Manuals for SWAN 350

Newsgroup: rec.radio.amateur.equipment
Date: 1994-03-23 15:34:16 UTC
From: ldfrost@ldf.b24a.ingr.com
Message-ID: <2mpnho$1k4@b8.b8.ingr.com>
Source record: 227690

My only HF rig is dead, and I don't have any documentation for it. I am looking for any information that I can get on a SWAN 350. Im looking for manuals, schematics, and anything else I can get my hands on. I also welcome any advice on that you guys might have on working on this thing.

The current problems are:

1. CW key wont key transmitter.
2. Occasionally throws high voltage arcs inside the main unit or between the main unit and the power supply if they are too close together.
3. No Audio when transmitting voice.
4. Receive frequency is not stable. Sometimes sounds like the frequency knob is being spun wildly.

The transmitter puts a full 100 Watts into the dummy load when the radio is switched to "TUNE CW" and seems to have a fairly sensitive receiver when its working.

Some of the questions I am trying to get answers for right now are:

1. The CW key is hard wired to the connector and the plug is makeing good contact. Is this the proper way to hook up the key to this rig or is something else required?

2. I have seen radios that required a jumper in the auxiliary connector slot before the radio would key. Is the SWAN 350 one of those, and if so where should the jumper be?

3. What would cause the arcs? There is nothing obviously defective that I have found so far.

4. The system is not grounded. Is this causing the arcing problem, and will replacing the current power cord with a grounded cord fix the problem?

Thanks in advance for the help.

Source record: 227691

First of all, the current model is the TS-690 which is a TS-450 plus 6 meters. There is no longer a 6-meter version of the low-end transceiver. But, to the original poster, I would definitely try to pull together the extra Francs to get a TS-450 rather than either low-end model. The receiver section and the array of receiver filters on the TS-450 is so superior to the TS-140, that it pays to buy the higher priced rig. In the U.S., the price differential at Ham Radio Outlet is $229.00. I don't know about Europe.

If you're dumb enough to tell them that you had an amateur radio
installed when the cpu went out to lunch, then you should pay for the repair
($1K I heard on a Camry) yourself.

I have a 1991 Camry, and had no problems with a 50/40 watt Vhf/Uhf rig.
I heard the problem is with 1992 models and later, which I'll never own.

I just bought a Saturn SL2. I called their 800 service number to ask
about any potential problems with a ham radio. They responded that they
do not recommend installation of a "high power transmitter" (my words
originally), and if there is damage to the cpu, it won't be covered by
warranty. When I pressed them, they said that there were in fact no
reports of problems in the past. They did recommend keeping the antenna
as far as possible from the engine compartment.

I installed the same dual band VHF/UHF radio with a Larson dual band
through the glass antenna on the rear window and had no problems
whatsoever. I then really pushed the issue this weekend, and put in a
TS-50S HF rig. The antenna was a hustler, mounted on a trailer hitch
that I had installed the day before. I drove 950 miles over 3 days, and
worked 80, 20, 15 and 10 meters for hours at a time. Nary a cough out of

the engine. The only problem I did experience was electrical hash from the fuel pump. I called Saturn, and they said it's in the gas tank. However, the wire is accessible under the mat in the trunk, and they told me it was the gray wire. So I will get in there with some .01's to ground, and a couple of ferrite toriods and see if that cleans it up.

So, forget the Camry, and buy a Saturn. You'll get JUST as good of a car (maybe better), and keep a few more yanks employed. I absolutely love the car, it handles like a TR7 (remeber them?), isn't too bad looking, and runs absolutely great. The reliabily is also in the Japan class as well.

73's and good luck,
Wayne Roth

I am considering purchasing this tri-band HT and was wondering what kind of experiences people have had with it. I'm very curious as to how far out of band it will receive on the three bands and also in any mods there are for it.

Thanks, in advance, for any information you can provide.

-Jason

I was wondering if other 5200 owners could receive Air band transmissions.
I'm not even sure if the radio will switch to an AM receive mode in those
bands. I have performed the extended TX mod.

Cheap AF processors use AF clippers. DSP-based processors are not only
novelties now, but they are more xepnsive to built than RF processors.
Why AF clippers are worse than RF (IF) clippers? Consider a 500Hz
tone test. With AF processor you will get extra 1000,1500,2000,2500
Hz tones. With RF (SSB and DSB) processor 500Hz will be the only
output. Please note that some older rigs have "implicit" RF
processors. For instance, SWAN 500 has 7360, a beam deflection tube,
as a DSB modulator. By clipping peaks, it acts with the following XTAL
filter as a DSP processor.

Check out my article in Feb. 93 QST "Everything You Always Wanted To Know About Computer-Controlling Modern Radios" (I didn't pick the title :). It has plans for a Kenwood interface that is opto-isolated and implements the handshaking lines as well as the data for complete compatibility.

I also still offer the parts kits listed at the end of the article. Prices are the same, ($47 for Kenwood kit, $44 for Icom/Yaesu/Ten-Tec) but the address is now:

CW Technology
7328 Timbercreek Court
Reynoldsburg, OH 43068-1181

COD Orders Only (add $5) at 800-547-7479

The kits include PCB and all board mounted parts. You provide case and 8-15V supply.

NOTE: ARRL has the PCB layouts and the parts are readily available - you do not have to buy anything from me.

E-mail if you need more info

>but its number is something like MH-18 or MH-19. Does anyone have
>experience with this item? Does it work and how well?
>
I own one....its NOT an ear mike....

It has an Ear piece like the walkmans, and a lapel mike with a PTT switch.

I used it for a while....the PTT switch on the mike makes it hard to use and position the mike so that I don't have to shout into the air just so my voice can be heard by the mike....and yet it seems to have no trouble picking up surrounding noise.

The YH-2 head set suffers from ambient noise pick up too....and it mores or a problem, because if I'm using it..I'm usually running VOX. But, at least my hands are free for information collection....which happened at the last parade where we had to run around to all the vehicles and groups to collect information on them to relay to the announcers stand (we had planned to use packet as the link from the start of the parade to the stand, except we didn't have enough power to overcome the QRM from the police station....and all the police vehicles at the start.)

Another thing to watch if you get the MH19 (I think its 19 instead of 18), is have your radio off when you try to position the mike. Its extremely easy to accident key the mike while struggling with the *#!@ clip.

>is currently selling for I think around $290. They also have some new models
>out, a C158A I think it is that is around $250.00 and a C178A which is
>primarily a 2 meter rig but has 70cm but only with 100mW output on 70cm. I
>called HRO and they quoted me something like $399 for this one.

What!! For $20.00 more you can get a Yaesu FT530.
For $20.00 less, you can get an Alinco DJ580T.

Both REAL dual band HTs. Maybe they meant $299 for the C178A.

And regarding Standard, it seems that every product they advertise
in QST these days (from the inexpensive C158A on up to their top-
of-the-line dual-band mobile rig)) is claimed to have "superior
intermod rejection". So, Standard owners, is that true??

875. Motorola GPS engine group purchase update

Newsgroup: rec.radio.amateur.equipment
Date: 1994-03-24 21:30:18 UTC
From: bonomo@specxn.enet.dec.com
Message-ID: <1994Mar24.213018.25273@nntpd2.cxo.dec.com>
Source record: 227603
Cross-posted to: rec.radio.amateur.equipment,sci.geo.satellite-nav

Status on the Motorola GPS engine group purchase:

Greetings, all!

This is a quick note to let all of you who have responded to me that I am actively pursuing this venture. Two weeks ago, I telephoned Motorola and spoke with a woman who indicated she would send out information. Said information has not yet arrived.

This morning, I spoke with the Sales Manager for the GPS core product, Oncore. She is sending me a price quote for the 100+ unit order, along with specs. As soon as it arrives, I will post to these newsgroups. I will also be obtaining price quotes for the software which accompanies these units, which is to be used for DGPS and other things.

As of the writing of this memo, there are "orders" for 67 units, with "possibles" for ten others. I have several requests from overseas, which is not expected to be a problem. The sales manager is sending me information as to which areas have export restrictions, which I will also include along with the specifications. She also said some recent military evaluations indicated that this engine is the only one they found acceptable, and is sending that report information, as well.

For those of you who are reading about this for the first time, I am coordinating a group purchase of Motorola GPS core engines, collecting names for those who would like to participate in said activity. The rumor going around was that these $450 (single quantity) engines could be had for $150 in 100-unit lots. I have no idea as to the actual price, but it is "in the Mail", according to Motorola.

If you are interested, send mail with the quantity in which you are interested. When "critical mass" has been reached, I will inform all parties which have submitted their names of this fact, as well as post it to the newsgroups. At this time, monies will be deposited in an account, which will be used to pay for the purchase. When all monies have been deposited, the order will then be placed.

Again, I'll post any information in this when it becomes available.

Regards,

Tommy

From: jrl2@crux1.cit.cornell.edu
Message-ID: <jrl2.764576645@crux1.cit.cornell.edu>
Source record: 227607

Hello,
I was wondering how other owners of hw-8 like
their rigs. I enjoy mine alot for listening and
copying code though due to the fact I live in an
apartment I haven't been able to put up a
transmitting antenna.
I'll be moving in a month to a place where
I'll be able to put a good antenna. Could someone
point me in the right direction for building a
good antenna for the hw-8.
I would like to build an antenna or antennas that
would let me.
Transmit on 40
be portible (camping use) (backpacking)
So this could be 1 or 2 antennas I guess.

I have the ARRL antenna book which has good
(I guess) plans for a dipole which is simple
and in my skill range.
What has been your expiriance?

Thanks,
-

Superior to OTHER HT's, I'd suppose. I have the C168A and I do get intermod
here in Tucson, but only on an external antenna. Not having heard other radios,
I can't comment on the 168A's "superiority", but I'm otherwise satisfied with
its apparently decent rejection. (By "external antenna" I mean a mobile
antenna, or outside base station antenna.)

Clipping a full-carrier DSB (AM) signal is equivalent to clipping the positive peaks of the baseband audio. I believe that symmetrical clipping of a suppressed-carrier DSB signal is equivalent to clipping both + and - peaks of the baseband audio. If you want to get the full benefits of RF speech clipping, you have to do it on the SSB signal.

I saw one at the Toledo swap last Sunday. Very impressive. I think it
is basically a 737 with six meters built in. Has a ONE HERTZ DDS!

I noticed it received about 45-56 Mhz also.

What I was REALLY interested in was the new IC-820, dual band (VHF/UHF)
all mode base unit.

73 =paul=

All that stuff will be at Dayton, so said N7MBA.

What you are looking for is a TNC, Terminal Node Controller. You could build a unit for RTTY and another for WEFAX but you still wouldn't have Morse. See if you can pick up a multi-mode TNC (like the PK-232 I am willing to sell) and you will be in business.

I have the "Jumper 13" mod done to my 530, and I still have auto
repeater offset. When you cleared your memories (held down the arrow
keys while turning power on), you probably cleared the setting for
auto-offset. Once you re-enable this, you should be fine, even with
the mod.

Note: I have a "first generation" 530. YMMV

894. icom-2sat mod problem

Newsgroup: rec.radio.amateur.equipment
Date: 1994-03-28 06:27:11 UTC
From: mikec@ux5.lbl.gov
Message-ID: <2n5tbv$t2p@overload.lbl.gov>
Source record: 227622

I've these archive instructions mods for extended xmit for a 2sat:

"...Look for the big IC directly in the middle of the main board on the front
cover (IC-1 40608). Go to the bottom right corner of it. Move your eyes
slightly to the right and you will see three chip resisters in a row.
Just to the right of THOSE you will see three silk screened dots that are
bracketed by a rectangle of white ink lines where a factory diode package
..."

However, in my radio these pads seem to already have a diode
array (I think it's in an SOT-223 package?) occupying the sites!
Where am I going wrong?

Gary, check out rec.radio.swap, there's a lot of ads on there. You should
find what you're looking for on there. Also, if you have a local ham radio
store, ask there about any upcoming hamfests. You can also look for
hamfest listings in CQ magazine, and QST. If you have a radio or scanner,
listen to local nets on the repeaters, there's generally announcements
about equipment for sale, or upcoming swap meets.

896. Kenwood TM-733A & AIP

Newsgroup: rec.radio.amateur.equipment
Date: 1994-03-28 06:58:47 UTC
From: bobw@col.hp.com
Message-ID: <2n5v77$imu@hp-col.col.hp.com>
Source record: 227624

On the back of the April QST, Kenwood has a big ad for its TM-733A.
It looks like they got the message on the TM-732A receiver performance
and obsoleted it. The 733 feature set looks about like the 732 with
a few more bells and whistles here and there.

They talk about "Advanced Intercept Point" or AIP on this radio.
I recall some speculation on what this feature is or how its implemented
when they first started putting in their HF rigs. Anyone know what
AIP is for sure?

Anyone have the TM-733A? Come on, at least one of you Kenwoodites must
have run out and bought the first one.

897. Buying an HT -- Advice Wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1994-03-28 06:59:32 UTC
From: mrw13@bonjour.cc.columbia.edu
Message-ID: <2n5v8k$6dv@apakabar.cc.columbia.edu>
Source record: 227625
Cross-posted to: rec.ham-radio,rec.ham-radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.misc

I am interested in purchasing an HT would like some advice as to what are good models and the costs I am likely to run into. I plan on also using the HT as a scanner, so it must be able to pick up local police, fire, etc. as well as aircraft frequencies. I understand many HTs can get these frequencies but they need to be "modified" before hand, about how much does this cost? I have heard of dual-band HTs but am not totally sure as to what this means -- any helpful comments? One other consideration, I guess I might as well get a fairly powerful model as well (5 watts?) -- additional options (like getting cellular frequencies, a keypad with hundreds of features are nice, but not necessary. Where is the best and cheapest place to get such equipment? Also willing to buy a used model. Please email any responses.

Thanks in advance,

Marc Wollemborg
<mrw13@columbia.edu>

898. where to shop for used equipment, and no marketplace newsgroup?

Well, I own a TH-28A with about 10 million amazingly useless electronic features. The antenna sucks, the battery pack falls out when you clip it on your belt, and most annoyingly, it spontaneously switches from memory to VFO mode. The more you insist that it be in memory mode, the faster it switches to VFO. Thpppt. Don't even mention intermod. I can't turn the thing on near my PC. When I turn the computer off, every other electronic device from Anchorage to Barrow ruins the reception.

The reason I bought it is because Amateur Electronic was running a great special on it last summer.

Message-ID: <1994Mar28.092134.93@atlas.tntech.edu>
Source record: 227628

I am currently testing out the MFJ 20 meter SSB. Used it in the
CQ WPX contest this weekend with a lot of success. It is very impressive for
tthe type of rig it is.

I did put it in my car and test it.. it doesn't have a noise blanker
.. It may just be my car.. but didn't do too well.. I just hooked it
in the cigarette lighter.. need to try to go directly to the
battery and put a noise filter on it before I really would put it down.

It works great off a gel cell.. have had GREAT audio reports on the rig. Had
a DX station stop in the contest when I told him what I was using. he
started to laugh and told me I was the loudest signal coming into him with
a large pileup.. I was using a Quad .. which helped. but with all the high
powered stations on with good antennas.. was real impressed with the MFJ
I really like the receiver. .and the mike that you can get with it has a
good feel to it.

>can you believe it. if you decide to get rid of 440 let me
>know.
>73,dave

I'm a satisfied owner of an Icom IC-765.
I don't know what to say about IC-737 but what I can
say is that 765 is, for me, the best transceiver on
the market, over the TS-950SDX too.
The reciver unit is wonderful, specially the IF-shift
control, very useful in 40m band to lean out noises
splatters and intermodulations.
But let me say one thing : when I went to the place
where I bought my 765, owner said that 737 has no "win"
chances vs. 765. It's not a coincidence that, here in
Italy, 765 has the price of two 737s.
So, I'm surprised about Icom suggestion. Maybe who talked
had drink two litres of wine !! (HI)

Yes, I did, but it still didn't work. Mine may be a 'later generation'
model, and this may be a side-effect of that. My set of jumper pads is not
two parallel lines, if that means it is a later model.

I read in this newsgroup about what other goodies Yaesu is keeping hidden?
With the mod, one can rx(tx) upto 180 MHzs then there is a gap
until you get to 300 MHz (rx) or 400 MHz (rx/tx). Would have be nice if
the 220 band was included. Then we all would have tri-band tranceivers.

912. SUMMARY:2m HT recomendations

Newsgroup: rec.radio.amateur.equipment
Date: 1994-03-28 17:20:57 UTC
From: harland@otter.mech.ubc.ca
Message-ID: <2n73lp$ot6@nntp.ucs.ubc.ca>
Source record: 227639

Summary of 2m HT recomendations:
First the specific features that people use/like is laid out
then I will list responses by manufacturer.

Responses to date: 14

Feateures:

Power: 2 people say 2-3W is enough fo local use
4 people say 5W+ is needed for longer distances

DTMF: 4 - must have

CTCSS: 2 - good to have
2 - not worth it

Paging: 2 - not worth it
1 - have but never use

Lighted Keypad: This came up quite frequently --> good idea

Manufacturers:

Kenwood:
28A: 4 - problems with intermod
2 - battery falling out
2 - poor battery life
78A: 1 - intermod
27A: 2 - good reviews but 1 poor battery life
22AT: 1 - good review
1 - Kenwood not woth the money

Radio Shack:
202: 5 - good reviews

Yaesu:
FT-530: 3 - good reviews
FT-416: 1 - very good review

Alinco:
DJ-180T/H 1 - very good review
1 - Alinco not worth them money

Standard:
C168A: 2 - good reviews

I-COM:
2GAT: 1 - big but worth it

Which one will I buy ?
I am going to check into Radio Shack but I am now looking
towards a Yeasu FT-530 or FT-411.

Thanks for all the great info, I would have bougth Kenwood
had it not been for all the intermod problems.

I hope this summary will help someone else who is also in the
market for a 2m HT.

I don't know what Kenwood is talking about with Advanced Intercept Point, but it seems to be a way of saying they have improved the intermodulation performance of the receiver. The intercept point is one way of measuring intermodulation sensitivity of a receiver.

915. Linear Amplifiers

Newsgroup: rec.radio.amateur.equipment
Date: 1994-03-28 20:56:03 UTC
From: lvn@cen.com
Message-ID: <2n7g93$4ee@paperboy.gsfc.nasa.gov>
Source record: 227643

I am looking for a small (500-600 watt output) linear amplifier. I saw two nice ones over the weekend at a local hamfest and would appreciate hearing from anyone who has one of these (or another that they really like).

- Drake L75, using a single 3-500Z.

- An Amp Corp (?) no tune amp.

Both cover 160-15 and have not had any 10 meter mods done to them. I also saw two nice Heath SB-220's which run about twice the power and cost less.

Any advice on your favorite (or least favorite) linear will be welcome.

916. Synth. GE Mastr Exec II conversion...

Newsgroup: rec.radio.amateur.equipment
Date: 1994-03-28 21:42:01 UTC
From: carndt@netcom.com
Message-ID: <carndtCnE9M2.8z2@netcom.com>
Source record: 227644

I have a VHF Mastr Exec II full duplex radio I will be removing from IMTS service shortly. I have been studying the manual to see about converting it to 2 meter use. If I understand the docs correctly, I can change the frequency of the ICOM appropriately, and retune the transmitter and receiver, and wind up with a 32 channel radio, the 32 frequencies being in order, separated by the freq of the reference ICOM.

Is this interpretation correct? Are there any other parts to change, or other gotchas I need to be aware of. I doubt the filter duplexer is good enough to use at 600 Khz split, and may not tune down that far anyway, so use as a portable repeater is out, but I could use it as a regular 2m xceiver.

Thanks for any help.

Chris KD6DSI

```
OK, UHF measurements for sensitivity and intermod....

Raw F3E sensitivity (opens squelch set at threshold):

UHF receiver (right side):

Freq (MHz) Pin (dBm)

300 -83
315 -96
330 -105
345 -111
360 -117
375 -122
390 -122
405 -121
430 -122
445 -122
460 -120
475 -119
490 -115
500 -114

VHF receiver (left side):

PLL does not lock for 300 MHz:

Freq (MHz) Pin (dBm)

300 x
315 -74
330 -74
345 -77
360 -71
375 -84
390 -100
405 -100
430 -118
445 -122
460 -115
475 -105
490 -104
500 -104

TTID (Twin Tone Intermod)
```

f1 = 445 MHz, f2 = 446 MHz, tune 447 MHz for 3rd IM:

breaks squelch at -66 dBm on UHF side, -69 dBm on VHF side.

f1 = 475 MHz, f2 = 460 MHz, tune 445 MHz for 3rd IM:

breaks squelch at -59 dBm. NO VHF side measurement (sorry).

What this means: For best IM rejection, listen to UHF on the VHF side! As advertised in the manual, cross band RX has a narrower range, and hence better out of ham band IM rejection. Didn't test this on the bench, sorry, but remember that 1 dB of RF attenuation drops the 3rd IM products by 3dB......

More numbers when I have time, next will be VHF sensitivity and IM rejection, followed by UHF+ (800 MHz) measurements.

People that are dying for a particular measurement can mail me and I will try to set it up.

-Ken

p.s for those that must know, my FT-530 has the Jumper 13 mods done, and the serial number begins with 3D131...

928. AEA Hot Rot whip for HT

Newsgroup: rec.radio.amateur.equipment
Date: 1994-03-29 12:34:55 UTC
From: ah301@yfn.ysu.edu
Message-ID: <ah301-290394073455@sy_j.pgh.wec.com>
Source record: 227556
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.antenna,rec.radio.amateur.misc

I recently purchased an AEA HotRod 1/2 wave whip antenna from Kevin Jensen N1KCG from rec.radio.swap. He used it in his htx202 and said it was working.

However, when I got the antenna and connected it to my antenna, I did not get better coverage with the hotrod compared to the htx202 rubber duck antenna.
In fact it was worse, what I can reach with the rubber duck antenna, the hotrod antenna cannot.

I do believe Kevin when he said it was working with his ht (although he did not respond to my email when I asked him how come it was not working on mine).

Is there any tuning or fix I can do to make this antenna work ? or was I sold
a broken antenna ? I can still hit repeaters that are very close. I tested

it on an swr meter and its swr is > 3, my rubber duck is < 1.5 !

please email replies if possible
thanks in advance

>
>*Sigh* Here we go again...
>
>"Quadrature" means exactly what I said above, a 90 degree phase difference.

I know that. I'm not arguing with you, just introducing an alternate
term for the I and Q channel phase relationship. Where I am arguing
with you is on a slightly subtle point. See below.

>: There must be a net 90 degree difference *at any given
>: frequency*, but the phase at say 300 Hz vis 3000 Hz is irrelevant
>: to the SSB generation, but not to the sound.
>
>True, but the way 90-degree phase shift networks work is to generate
>two signals with phases that ramp linearly with frequency, but always
>90 degrees out of phase. If the ramps weren't smooth, the phase
>difference wouldn't be 90 degrees.

Now this is where we differ. What's important to phasing SSB is that
I - Q = 90 degrees at each given frequency. You can have that with
an irregular frequency response as easily as you can with a smooth
declining ramp. What I'm talking about is the phase relationship
between different frequency components of the waveform. Let's assume that
we have two frequencies X and Y. They will have a phase relationship at
input defined as,

X(t) - Y(t) = K(t)

Now if we put this through a transmission media, a blackbox
network we'll call B, then the following condition must apply
if the phase relationship of the complex waveform is to be
maintained.

B(X)(t) - B(Y)(t) = K(t)

But that's not the response we get with a first order smooth
RC network with a declining linear phase delay versus frequency.
I and Q have to have a 90 degree difference, but that can be
generated a number of different ways. We can add delay in one
branch only, so I' = I and Q' = Q + 90. Or we can use lead/lag
networks so that I' = I + 45 and Q' = Q - 45. Or any mixture
in between. All the SSB phasing network cares about is that
there's quadrature at each given frequency. How each frequency
gets quadrature is irrelevant to the phasing exciter, but it's
not irrelevant to the resulting differential phase between two
frequency components of the input.

>: Ask yourself how many
>: milliseconds is a 90 degree phase delay at 300 Hz, then ask yourself
>: how many at 3000 Hz. ...
>
>That's why there is less phase shift at 300 Hz than 3000 Hz (phase ramps
>linearly with frequency, see above.) Linear phase = constant group delay.

I don't see what you're saying here. You need quadrature at every different
frequency, at 300 Hz and at 3000 Hz. The phase shift has to be the *same*
at every frequency (90 degrees), but that means the *delay* declines with
increasing frequency since it takes less delay to get 90 degrees of phase
shift at 3000 Hz than it does at 300 Hz. In other words, the high frequency
components start to outrun the low frequency components as they go through
the network because they suffer less delay. That can be seen in a television
system as chroma/luminance misregistration, also known as differential
phase distortion. Such delay characteristics aren't easily visible in
complex audio waveforms with ordinary scopes, but it certainly can be
heard. That's the click-boom effect I mentioned in the first post where
a percussive strike's high frequency components have outrun the low
frequency components.

>: >Same thing with amplitude flatness. The phase shift network's two
>: >channels must be matched to within a fraction of a dB to get good sideband
>: >suppression.
>
>: Same thing with amplitude flatness. The amplitude has to match *at
>: a given frequency* ...
>
>Again, the way to get amplitude matching is to make both channels flat.

It's *a* way to do that, but it's not necessary, or likely in real
circuits. All that's necessary for the SSB phasing exciter is that
I and Q have the same amplitude at any given frequency. There could
be many db of amplitude difference between two different frequencies

in either the I or Q channel as long as the same difference exists
in the complementary channel at that frequency. In other words, the
bandpass amplitude response could be very lumpy as long as the lumps
in both I and Q match. In fact, with a first order RC network, the
response is going to change by 3 db per octave.

>delay as an audio filter of similar bandwidth and rolloff characteristics.

I've been scratching my head over this. Since the percentage bandwidth at
9 MHz is so small, the Q has to be much higher which translates into more
filter ringing than in the very broad percentage bandwidth AF delay network.
But it seems to me that the differential delay of the lower Q audio filter
would be greater since the delta time span for a 90 degree phase shift is so
much greater for a 5 octave span than for a fraction of an octave span.
Perhaps they equate to the same percentage distortion, but is it the same
kind of distortion?

Will it power the HTX-202? I'd get a DEFINITE answer first on the voltage range the HTX-202 accepts; don't count on the HT surviving excessive voltage.

If it's not too much, and it doesn't have too much ripple, then you can probably use the adapter FOR RECEIVE ONLY. The 1A output can't be enough for transmitting; I expect you will get a truly AWFUL HUM when you try it. But as long as you don't exceed the current capacity of the adapter (rated 1 A), it may well be nicely regulated DC and hum-free for receiving.

Apples and oranges. The phasing SSB exciter is using an audio
phase shift network, the filter exciter is using a RF filter.
Now the AF phasing network may be considered a sort of filter,
but that's not it's designed purpose, and for sure it's not a
3 kHz bandpass response. Instead it has to maintain a constant
90 degree phase shift across multiple octaves. That's tougher.

That works for frequencies abouve 800 MHz, but apparently not for between
500 and 800 MHz or so. To enter a frequency in the 500 MHz range, I have to
enter 800, and work my way down with the down arrow key or VFO knob.

Cheers,
Tom

Source record: 227568

John, I have fiddled with the one at the HRO here in San Diego.
It has 100W out, and is similar in size if not the same as the 737.

Spies say it is a better radio than the 737.

There were gaps in the reciever; it wouldn't dial into the 15MHz
between 45MHz and 30MHz, when I tried.

AC powersupply built in; no apparent place to apply external DC power,
so this will be a limited portable rig. I don't trust generators for
my rigs, as I've seen them get damaged by spikes etc; I use batteries
exclusively.

I own the TS-690, so this radio is of interest, but I prefer the 690
still. The buttons are large enough and the display is sunlight
readable, but other limits make this radio less interesting to me.

For the price, you could buy the TS-50 and TS-60 together, I think.
Not the same sort of thing, but something to consider if you're going
portable with the radio, IMO.

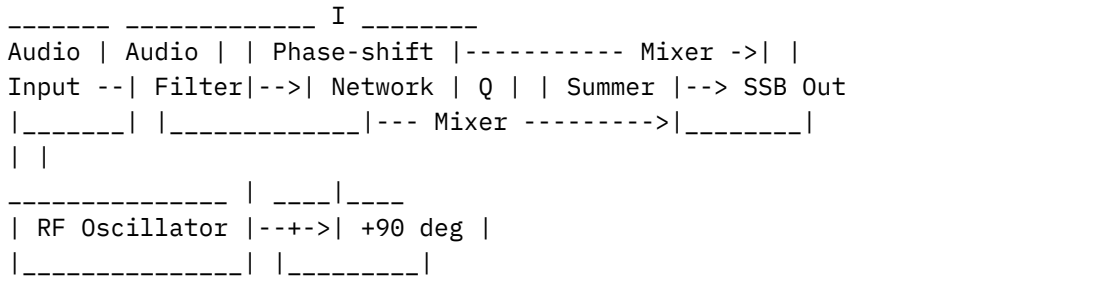
I recently hooked up an MFJ tuner with a long wire, and also was puzzled
by the dotted line indicating a bridge. I tried it both ways, and it made
no difference at all. So I didn't bother shorting the terminals. Works fine.

942. How phasing SSB Exciters Work (Was: RF and AF speech processors)

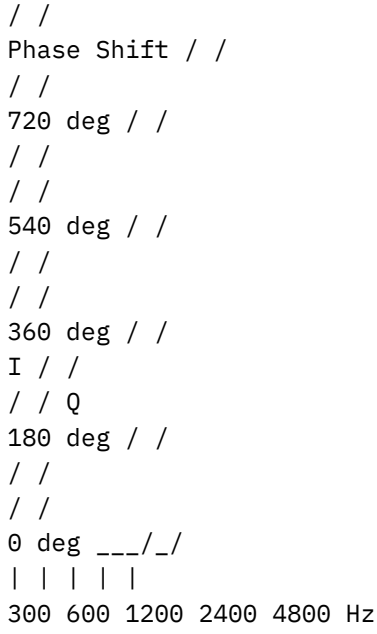
Newsgroup: rec.radio.amateur.equipment
Date: 1994-03-29 21:26:17 UTC
From: alanb@sr.hp.com
Message-ID: <CnG3Jt.Htw@srgenprp.sr.hp.com>
Source record: 227570
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

In another thread, I claimed that phasing-type single-sideband generators sound better than filter-type generators because phasing exciters have flatter amplitude and delay response. Gary Coffman disputed that. Rather than respond to Gary's long replies in detail, I'll just summarize how phasing-type SSB exciters work:



I and Q are two audio outputs with a constant phase difference between them of 90 degrees. The input filter limits the audio frequency response to the range of the phase-shift network. The "+90 deg" box can be switched to -90 degrees to get the opposite sideband. (The output of each mixer is a DSB signal.)

The audio phase shift network is the interesting (read difficult) part of the system. It must maintain a 90 degree phase difference and excellent amplitude matching between the two outputs over something like a 10:1 frequency range (300 Hz - 3000 Hz). It generally does that by causing each of the two outputs to have a constantly-rising phase shift versus frequency characteristic, like thus:



Frequency

I may have gotten the scaling off a bit, but the principle is right:
Both channels have constantly-changing phase shifts, but the difference
is always 90 degrees. Note that the frequency scale is logarithmic.
If phase were linear with frequency, then that would equal constant
delay. Since that's not true, there is some variation in group delay
with frequency, but it is a nice smooth curve that has little affect
on audio quality. (As opposed to the crystal filter used in a filter-
type SSB generator which has "bumpy" group delay, expecially at the
high and low band edges.)

The design of the two channels' phase-shift networks is such that
any errors in linearity occur in different places. That means that
you can't make it work properly unless both channels have nice
linear phase versus log(frequency). The same goes for amplitude.
I suppose you could design a diabolical phase-shift network that
had unflat (but matched) frequency response in the two channels,
but why would you do that?

The input audio filter can also add to amplitude or delay distortion.
However, it's not hard to design the filter to minimize the problem.
You don't need the sharp cutoff of a crystal filter designed for
receiving applications because any spurious below 30 or 40 dB down
will be covered up by the transmitter power amplifier's splatter
anyway. Also, audio filters are easier to build accurately than
crystal filters because of the lower Q and lower frequency.

The conclusion: Phasing-type SSB generators have flatter group delay
and amplitude than filter-type generators. You really can hear the
difference in the on-the air signal, in my experience.

Gary Coffman (gary@ke4zv.atl.ga.us) wrote:

But the hard part is getting the ampltude and phase matching
to within a fraction of a dB or degree. As explained above, if you
do that, the overall amplitude and delay response versus frequency
will be quite good.

Yes, it is a cult!
Seriously, while I own or have owned equipment from many manufacturers, I have not found any HF equipment better than Kenwood in regard to performance, price/performance ratio, and ergonomics. I currently use a Kenwood TS-850. With the optional CW and narrow SSB filters, it makes a fine rig for contesting and DXing, as well as casual ragchewing.
Of course, this is all just my humble opinion.

Phasing type SSB exciters produce a higher fidelity output
than filter type exciters *using filters of the type typically
found in ham equipment*. If you get high quality filters like
the Lumda FDM telecom filters, you get do just as well with
a filter type exciter. These filters will run you about $125 each.

In any event, if the receiver is a transceiver, and it uses
the same filter for receive and transmit, then all the nasty
ripples you avoided with a phasing type transmitter will
be reintroduced at the receiver. So you really need a phasing
transmitter and phasing receiver to get "hi-fi" audio. Or
use Lumda filters at both ends.

(Lumda is a small outfit that took over the FDM xtal filter
market when the big boys pulled out after T1 replaced FDM for
99% of the telecom market. FDM is still used for phone calls
to Alaska and Hawaii. It's SSB but doesn't sound like ham SSB.)

From: member6100@aol.com
Message-ID: <2nbapo$p1p@search01.news.aol.com>
Source record: 227580

In article <1994Mar29.154854.25844@bnlux1.bnl.gov>, gc@sirius.ccd.bnl.gov (Graham Campbell) writes:"Want to install a HF ham rig on my boat for long distance communications. I am asking for recommendations."

This month's "Practical Sailor" speaks highly of the SGC-2000 HF transciever when compared to its plain marine SSB competitors. Built to commercial/marine SSB standards, it's unique in being approved for the Ham Bands as well as marine SSB. It tunes via pushbuttons (no dial) otherwise it seems to offer both uses in a single package designed for a marine environment. A bit pricey ($1995 list) for ham only, its a relative bargain compared the cost of two individual radios.

I'm new to ham radio, soon to get a tech. license but plan to upgrade quickly to get onto HF. I'm looking for a used rig to accomodate present interest in listening in on marine nets and 30 meter broadcast stations, therefore would like to include a good quality general coverage receiver, even if at the expense of some transmit power or flexability. The "Yellow Sheets" and other ads seem to have plenty of Kenwood TS830 or Icom 735's but I haven't talked with anyone who is really familiar with these in order to know if they (or others) would be appropriate. I would really appreciate hearing from anyone with any advice or experience re: these radios. Thanks.

TTARS, The Tennessee Technological Univeristy Amateur Radio Society is proud to announce a Special Events station. The station will be tested on Friday April 15 and be on the air Saturday April 16 and Sunday April 17. The purpose of the special events station is to demonstrate the effectiveness of low power HF communications on both SSB and CW.

The event will take place in remote sections of Fall Creek Falls state park in Tennessee. We will be testing out the new MFJ 20 meters SSB travel radio, some new QRP CW transceivers and hopefully some other new toys.

For a nice certificate send a 9X12 SASE with QSL card and contact number to:

TTARS
Tennessee Tech. U.
Box 5262
Cookeville, TN 38505

*probably start afternoon of Friday April 15.

Sat. April 16 and Sunday April 17

14:00-16:00Z (7.250-2.270)
(7.055-7.065)

16:00-17:00Z (14.250-14.265)
(14.055-14.065)* if enough ops

17:00-18:00Z (28.350-28.365)

18:00-20:00Z (21.250-21.265)
(21.050-21.065)*

20:00-22:00Z (14.250-14.265)
(10.110-10.115)*

22:00-24:00Z (7.250-7.270)

00:00-02:00Z (3.900-3.915) or
(7.250-7.270)

==========

* we will operate on whichever band has best propogation. We will attempt to stay with the above frequencies as much as possible. The way conditions have been lately, 20 meters

will most likely be our main backup band.

thanks

> The adapter and the radio are both center postive
> shell negative for the plug.

Logically, if the adapter is relatively clean DC, it should work (since that jack can be run off a 13.8V car electrical system). Also, I would think that 1 A _should_ be enough to allow both transmit and receive. I would call your local R.S. store and ask them if they can pull an HTX-202 manual from their stockroom and look up the voltage range and polarity for that jack. Once you have checked those two things, if you are brave enough to want to do this, simply try it and see what happens.

I know I have a 12V@100 mA wall plug that I use for my scanner, and for receive-only it seems to power the HTX-202 fine, so I would think an amp should be enough to get you at least 3 or 4 watts of output power.

Good luck,
/Matthew

The instructions say to bridge the dotted line with a jumper when
using balanced feeders. Leave it unbridged and hook the wire to 'wire'
when using just an, ahem, 'wire.'

: Apples and oranges. The phasing SSB exciter is using an audio
: *phase shift network*, the filter exciter is using a RF filter.
: Now the AF phasing network may be considered a sort of filter,
: but that's not it's designed purpose, and for sure it's not a
: 3 kHz bandpass response. Instead it has to maintain a constant
: 90 degree phase shift across multiple octaves. That's tougher.

Actually, what I was writing about was Gary's misconception that
phase distortion is somehow much easier to deal with if you
move the center frequency higher. Its actually tougher--just try
and build a crystal frequency with good phase characteristics
and a good shape factor. (Or, try and buy one...) Of course, it
is true that you need an audio filter for a phasing exciter, as
there are limits to how broad you can make the phase shift network.
Fortunately, there is no requirement to transmit 60 Hz hum with
perfect fidelity.

I would agree that it isn't necessary for a phasing rig to have low
phase and amplitude distortion--I'm sure that someone could work
really hard and come up with one that sounded awful and still
managed to reject the opposite sideband.
The dark side of DSP? :-)
But, in practice, the easiest way to make one to work well is
to just go ahead and design for low distortion.

FWIW, one of the fanatical AM types showed off his phasing
receiver at Deerfield NH a few years ago... Guess he didn't
notice the distortion Gary is worried about. Come to think
of it, I don't recall hearing complaints about the Sony
2010's audio quality, which also uses audio phase shift
networks. (go through the archives of the shortwave newsgroup?)

Alan Bloom (alanb@sr.hp.com) wrote:
(concerning the generation of quadrature phase audio signals)

: But the hard part is getting the ampltude and phase matching
: to within a fraction of a dB or degree. As explained above, if you
: do that, the overall amplitude and delay response versus frequency
: will be quite good.

So, just how good is a practical network?

In some recent ARRL pubs (e.g., ARRL Handbook, 1987, pg 18-9) there's
a "matrix" type of phase shift network that claims to be able to give
good performance with loose-tolerance parts. I put this network into
Spice last nite, and thought some might be interested in the
results. Below are four columns plus a frequency column. The
second column is phase of one output channel. The third is that
phase with a constant 235 degrees and a ramp at -.066 degrees/Hz taken out.
The fourth is the magnitude frequency response for that channel.
The fifth is the magnitude frequency response with an additional
5-pole Butterworth low-pass at 3kHz and 5-pole Butterworth high-pass
at 320Hz, to limit the audio passband to the 300Hz-3kHz voice band.

(I hope tabs in the table won't make it unreadable at too many sites.)

freq	phase error	mag	filtered mag
Hz	degrees	degrees	dB	dB
200	-193.5	54.6	2.2	-8.4
230	-203.8	46.4	1.9	-6.1
264	-214.0	38.4	1.6	-4.0
303	-224.4	30.6	1.3	-2.3
348	-234.9	23.1	1.0	-1.2
400	-245.6	15.8	0.7	-.5
459	-256.5	8.8	.5	-.1
527	-267.6	2.3	.3	0
606	-278.8	-3.8	.2	0
696	-290.2	-9.2	.1	0
800	-301.6	-13.8	0	0
919	-313.1	-17.4	0	-.1
1056	-324.5	-19.9	0	-.1
1213	-335.9	-20.9	0	0
1393	-347.1	-20.2	.1	0
1600	-358.4	-17.8	.2	0
1838	-369.5	-13.2	.4	0
2111	-380.4	-6.1	.6	-.1

2425 -391.1 3.9 .8 -.5
2786 -401.7 17.2 1.1 -1.2
3200 -411.8 34.3 1.3 -2.4
3676 -421.5 56.1 1.6 -4.1

Note: I didn't calc the phase error including the Butterworth filters, which are NOT linear phase, but better than the Chebyschev typically approximated in a crystal filter.

The exact meaning of the "phase error" column is certainly open to discussion, but to me it's obvious that it's a very low error, and quite smooth with frequency. And both the magnitude columns show extremely good flatness in the voice band: particularly the one including the out-of-band audio filters.

I didn't include columns about the phase and amplitude difference between the channels, but it's a very close match in both.

(I hope to follow this with another followup about actually achieving 90 degree phase differentials with a finite number of poles and zeros, but that will have to wait for now.)

Well at worst I've stirred up an interesting discussion. :-)

In article <CnG3Jt.Htw@srgenprp.sr.hp.com> alanb@sr.hp.com (Alan Bloom) writes:

>The audio phase shift network is the interesting (read difficult) part
>of the system. It must maintain a 90 degree phase difference and
>excellent amplitude matching between the two outputs over something like
>a 10:1 frequency range (300 Hz - 3000 Hz). It generally does that by
>causing each of the two outputs to have a constantly-rising phase shift
>versus frequency characteristic, like thus:
> / /
>Phase Shift / /
> / /
> 720 deg / /
> / /
> / /
> 540 deg / /
> / /
> / /
> 360 deg / /
> I / /
> / / Q
> 180 deg / /
> / /
> / /
> 0 deg ___/_/
> | | | | |
> 300 600 1200 2400 4800 Hz
> Frequency
>

Now this chart illustrates the problem I've been talking about. As
we can see, the difference in delay with frequency is quite marked.
Sure the phase delay increases *smoothly* with frequency delta, but
the magnitude of the error rapidly climbs with increasing frequency
delta. This is our old friend click-boom. From 600 Hz to 2400 Hz delay
decreases by almost 20%, or about 0.2 ms. That much delay difference
is clearly audible.

If we look at Tom Bruhns' chart for a more complex matrix network:

phase filtered
>freq phase error mag mag
>Hz degrees degrees dB dB
>200 -193.5 54.6 2.2 -8.4

>400 -245.6 15.8 0.7 -.5
>527 -267.6 2.3 .3 0
>606 -278.8 -3.8 .2 0
>696 -290.2 -9.2 .1 0
>800 -301.6 -13.8 0 0
>1056 -324.5 -19.9 0 -.1
>1213 -335.9 -20.9 0 0
>1600 -358.4 -17.8 .2 0
>2111 -380.4 -6.1 .6 -.1
>2425 -391.1 3.9 .8 -.5
>2786 -401.7 17.2 1.1 -1.2
>3676 -421.5 56.1 1.6 -4.1

Now this is much better. The ends are horrible of course, but in the region 600-2400 Hz there is only a delay delta of 0.014 ms. That's hardly audible at all to someone with *good* ears. I'd note that this matrix phase shift network is considerably more complex than typical networks found in older phasing type equipment. And as Richard Karlquist noted, that's all for naught anyway unless the IF filtering of the receiver has correspondingly flat phase delay. Good RF filters can be as flat away from their edges as the matrix above, and RF filters work both ways.

Gary

The HTX 202 operates at automotive 13.8VDC (typically 14.5 V)
The output varies with voltage. At 12VDC expect abt 5 W out and a current drain around 1 Amp. The current will of course increase with higher voltage.
The DC connector is center positive and is the most common size.

> versus frequency characteristic, like thus:
<much deleted>

So, the audio phase shift is the only 'interesting' part...
How, pray tell, can one having only the usual ham test gear (scope,
probably, dmm, maybe power supply) make the RF phase shift be 90
degrees and the same amplitude at, say 12MHz?
My dual-trace scope is not perfectly calibrated, so that's
out. Generating 48MHz and using flip-flops to get 12MHz in quadrature
doesn't work well in reality (theory is great, but unless your 48MHz
signal is *exactly* 50% duty cycle it has a *strong*component at just
under half of 48MHz, usually near 22MHz. Flip-flops, like all
non-linear devices, are very good as mixers, and the 22MHz mixes with
the 12MHz to make some *interesting* spurs. Filtering out these spurs
usually trashes the 90 degree and equal amplitude you got in the first
place, leaving you back at square one.)(yes, i do know about this.
i've tried it. repeatedly. i KNOW phasing sounds better, and i

WANTED it to work *sigh*). Generate it in quadrature with a dual DDS
and two DACs? Then you must filter the DACs outputs through two
different filters, introducing slightly different phase and amplitude
errors.
I wanted it to work. Really. I've listened to DC receivers
and to crystal filtered super-hets and the difference is amazing.
However, I also want to be able to build a receiver and actually *use*
it, not spend eternity designing the 'perfect' one.
One other interesting thing re: phasing vs filtering: you'll
need *some* additional filtering to do a transmitter anyway (for SSB
at least). This filter will cost you $$, and if you already have to
spend the $$ why not use it for the receiver too? That rather neatly
explains why darned few commercial ham rigs use phasing any more.

Source record: 227498

Anyone seen/bought a Kenwood 733 dual-bander yet? I'm really curious
to hear about receiver performance. They advertise that it has AIP,
Advanced Intercept Point. But they never say what AIP is. A new
1st mixer with a higher TOIP? A 30 dB switchable attenuator? What?

Over the past several years, it seems that whenever Kenwood wants to
add a new feature, to keep the price down they take out something
between the antenna connector and the first mixer. Prime example: TM-732A,
perhaps the worst mobile rig for intermod/overload that Kenwood has
ever made, with the TM-742 running a close second. Yes, I've used both.

Well if you look at the table Tom posted, you'll see that even a
matrix network audio phase shifter (published in the ARRL Handbook)
has lousy phase response at the edges too, and a simple first order
network is worse. The Dome networks and B&W networks used in older
designs were even worse. Now compare that to the phase response of
a Collins mechanical filter. Except at the *edges* it's phase response
is flatter. And as you noted, we can cut off the edges with a pre-filter
in either case. Bill Orr notes in his Radio Handbook that while 60 db
opposite sideband rejection is easy with a filter, it's difficult to do
as well as 40 db with a phasing network because of balance problems,
especially near the edges, which shows up as *distortion product aliases
in the passband*.

>FWIW, one of the fanatical AM types showed off his phasing

Better still consult the Hi Fi magazines. The Sony 2010, and
a few other AM receivers, have been *panned* for their poor
implementation of synchronous detection. Differential phase
distortion is a hot topic with the high end folks now, probably
because they've licked almost all the other problems. In
rec.radio.shortwave the 2010 was panned because it's synchronous
detector isn't really synchronous. It's actually a form of ISB
instead of correlating upper and lower sidebands as a true sync
detector does.

I just stopped by at my local Radio Shack and saw two marvelous deals on HT's. The 2-meter HTX-202 is on sale for US$ 188 and the 440-MHz HTX-404 is on sale for US$ 228. These prices are quite a bit cheaper than the normal price for such units. I've been watching these prices for about the last six months and haven't seen them on sale.
I am studying up for my technician no-code exam, do any of you know if there is a waiting period from the time I take the exam until the time that I can begin transmitting? Also, can someone out there tell me where I can find out the dates and locations of the exams? Any and all help would be greatly appreciated.

Well a couple dots of solder and a little wire will fix that right up. If your lazy just run the wires out the plug in the side and twist them together when you want light. If your ambitious, mount a micro switch in the rubber plug. That's the only way as far as I know.

cheers,
Dan

Source record: 227511

Hi,
I got my license 3 1/2 years ago, primarily to use 2 meters mobile.
I have done no HF, but would like to give it a try. Problem is I'm
not sure what equipment/antenna to buy. A few months ago I was ready
to buy a Yaesu FT-990 and dipole antenna, but upon calling AES and HRO
I was told that the dipoles I was looking at would not work with the
antenna tuner in the FT-990 or other radios in that class.

I live in a house on a 100 by 100 foot lot in a residential area. There
are a few 50 foot trees on my property. I would like an antenna which
would allow operation on multiple bands (I'm not sure which ones I want
to use), but also one that won't annoy the neighbors too much. I would
like to limit the cost of the equipment/antenna to around $2000.

Any suggestions would be appreciated.

So what?

The point is, does the audio phase shift networks used in the 2010
cause a noticeable degradation in audio quality as perceived by
the users of the radio? And, since we are primarily talking
about SSB, as opposed to AM, there is *no* benefit to having
a detector that can correlate the upper and lower sidebands--we
only have one sideband to work with on receive.

Actually, MFJ has a policy where if you want information about any potential product, you call the 800 number in QST and they mail you the owners's manual. Don't know if that speaks to the generosity of MFJ or the poverty of the owner's manuals :-)

: Wait... I am completely confused by Zack's arguments.

: A DSB signal that has a 1 kc modulation consists of two "carriers"
: spaced 2 kc apart, not 1 kc, no? (Imagine AM with 1 kc modulation.
: Now take away the carrier.)

Right. If you assume Zack meant .5 kHz modulation, then it makes sense:
The two sidebands are carrier + and - .5 kHz and the third-order
IMD products are carrier + and - 1.5 kHz. So the recovered audio has
a third harmonic, but no second harmonic. So symmetrical clipping of
a DSB waveform is the same as symmetrical clipping of the baseband
audio in that it generates odd-order products, but not even-order.

: > 300 600 1200 2400 4800 Hz
: > Frequency

: Now this chart illustrates the problem I've been talking about. As
: we can see, the difference in delay with frequency is quite marked.
: Sure the phase delay increases *smoothly* with frequency delta, but
: the magnitude of the error rapidly climbs with increasing frequency
: delta. This is our old friend click-boom. ...

Other people besided Gary may be confused by this, so I'll post an
explanation.

The graph above plots phase, not delay. A constant delay results in
a constantly-rising phase plot. For example, a 1 millisecond delay
is 36 degrees at 100 Hz, 360 degrees at 1000 Hz, 3600 degrees at
10,000 Hz, etc.

Constant delay does not cause the "click-boom" that Gary mentioned. Think about it: You could record a voice on a tape recorder and play it back DAYS later without any "click boom." It's only when the delay is different at different frequencies (that is, the phase versus frequency plot is not a straight line) that there is a potential problem.

While the plot above looks like a straight line, it really isn't because of the logarithmic x-axis. However, as the chart that Tom Bruhns posted of a typical phase-shift network shows, it really isn't too bad. His chart shows that between 400 and 2786 Hz, the maximum phase error from a straight line varies smoothly between +17.2 to -20.9 degrees, which is far better than you would get with a typical transceiver-type crystal filter.

I expect most of the delay variation would come from the audio filter (that comes before the phase-shift network). Such a filter can be much flatter than a typical crystal filter for the three reasons I mentioned in a previous posting: (1) Doesn't need as sharp a cutoff as a receiver-type filter, (2) Can use a filter type with inherently flatter delay (non-Chebyshev), and (3) Pole Q and placement are much easier to control at audio frequencies than at RF.

Alan Bloom (alanb@sr.hp.com) wrote:
: In another thread, I claimed that phasing-type single-sideband generators
: sound better than filter-type generators because phasing exciters have
: flatter amplitude and delay response.

Yesterday, I posted results of a simulation of a quadrature audio network outlined in the ARRL Handbook. One thing to note is that the phase ramp is as Alan suggests in his posting. The "frequency" column is in 1/5 octave steps, and the delta phase between entries is practically the same across the band. So the phase looks like a straight line on a log-frequency scale.

But what if it was a design goal to come up with a quadrature phase network with flat frequency response and linear phase? Would that be possible? I think so, and I offer comments below in support of that idea. If I don't get to it, maybe someone else can check out the suggestion at the end to see if it really can work.

Soapbox: I'm treating this as a design problem, not something to wave my arms about. I start by summarizing some things that are likely to be relevant that could be tools to lead to a good solution. There is an assumption that flat response and linear phase will lead to something that people will think "sounds good." That may be wrong, but so far there seems to be good agreement about it. My purpose here is to simply explore ways to achieve this in a phasing system. This does NOT say that the same thing can't be done with filtering at carrier frequencies.

Observations:

0. The relative phase and amplitude response of a system can be completely determined by the positions of the poles and zeros representing the system; there is no need to commit to a particular physical implementation until the desired pole and zero positions are determined.

1. If a pole at -x+jy is balanced by a zero at +x+jy, the frequency response from that pair is exactly flat. The phase response, d(phi)/df, is exactly twice as much for such a pair as it is for the pole alone, at every frequency.

2. Techniques exist for putting poles at any interesting place on the left half of the s-plane, and for putting zeros at any interesting place on the s-plane. For example, for audio work, state-variable filter blocks can do this.

3. If one channel of a quadrature audio network has a phase ramp
vs frequency d(phi)/df = x, then the other channel must have
the same d(phi)/df over the band of interest to maintain a
constand phase difference between the channels. Since d(phi)/df
determines group delay, the two channels will have identical
group delays.

4. Linear phase is characterized by d(phi)/df invariant with frequency.

5. A strict delay has zero phase shift at zero frequency. Thus to
achieve quadrature phase, at least one channel will be characterized
by a phase shift in addition to any delay, even if d(phi)/df is
invariant over the band of interest.

6. None of the above precludes having a constant d(phi)/df in each
channel with a constant 90 degree phase difference between channels
and a flat frequency response in the band of interest. However, it
also doesn't tell you how to achieve this--it only provides some
hints.

7. A maximally-flat-delay (MFD) filter achieves a very constant d(phi)/df
over its passband.

8. A MFD _lowpass_ filter has nearly constant d(phi)/df through zero
frequency, and zero phase shift at zero frequency. It represents a
simple delay.

9. A MFD _bandpass_ filter has nearly constant d(phi)/df over its
passband, but not outside. The result can be a phase shift relative
to a MFD lowpass in the shared passband. THIS IS A KEY TO A POSSIBLE
ANSWER TO THE ORIGINAL QUESTION!

10. It _should_ be possible to find a pair of MFD filters with overlapped
passbands (either two bandpass filters or a lowpass and a bandpass)
which have equal d(phi)/df and a 90 (or 45--see paragraph 11) degree
phase difference between the channels in the shared passband.
Actually finding such a pair is the exercise remaining to be done!
Any volunteers?

11. MFD filters are notorious for non-flat amplitude response. This can
be taken care of by invoking paragraph 1: put a zero in for each pole,
which will double d(phi)/df and make the frequency response dead flat.
This is why we only need 45 degrees between the MFD filters used as
prototypes as suggested in paragraph 10.

12. Expect that it will take fairly high order filters to accomplish this
over the 300Hz-3kHz band. Tenth order wouldn't surprise me, to get
0.1 degree matching. The amplitude matching will depend only on
how accurately the implementation can place the poles and zeros at
the desired positions.

As a simple feasibility check, I asked a curvefitter to fit to a couple
linear phase ramps with constant amplitude, offset by 90 degrees, in the
range from 300Hz to 3.5kHz, and it didn't have any trouble getting

within a tenth dB and under a degree, with about 14 poles and 14 zeros
for each. None of the poles was particularly high Q: max about 8.

991. Distorted Audio on Yaesu FT-530

Newsgroup: rec.radio.amateur.equipment
Date: 1994-03-31 22:02:29 UTC
From: meike@interval.com
Message-ID: <meike-310394140229@mac-142.interval.com>
Source record: 227518

I just got an FT-530 yesterday. Its a great rig, but I was kind of annoyed to find out that the audio distorted quite badly when I turned the volume up loud enough to be heard in a moving car (admittedly this was most of the way up, but the distortion was suddenly quite annoying). Even the optional speaker/mic wasn't much better. Has anyone else out there had a similar experience, or do I have a defective unit that I should return.

Thanks,
-roger

>Jeff Kilgore, KC1MK (kilgore@tivoli.com.net)

Well, I saw the prototype last year, and talked to the person who is behind
the effort (his name is Herb but his call and last name escape me). He was
one of the principals in the old Atlas Co. Delivery was quoted for November
or thereabouts. It did look like he was going to be using people's deposits
to bankroll final development, which can be dangerous.

The one that Jeff refers to was an out-and-out scam and there was nothing real
about it. I don't think the 310 is a scam but I would encourage people to be
very cautious about the deal. I hope the guy does succeed, though.

Randy Cole
KN6W
cole@soldev.tti.com

BTW, he's been advertising it in WorldRadio, if anyone wants to see a
picture of the prototype.

I'd be very interested in hearing from somebody who really knows what's going
on, though.

994. Hamfest List - Mid Atlantic States

: :
: If you clip an ideal DSB waveform (1 kHz modulation), aren't there

Oops, this should be 500 Hz modulation, not 1 KHz modulation in the
parenthesis.

: two tones spaced 1 kHz apart that could generate IMD products at
: 1.5 kHz and 1.5 kHz (receiver output)? What if you had a significant
: amount of carrier leakthrough that was cleaned up by the crystal
: filter? Couldn't this give you extra tones at 1, 1.5, 2, and 2.5
: kHz (at the receiver)?

What this means is that having two crystal filters, one before and
after the clipper, results in less distortion on your transmitted
signal. The extra filter can also be useful on receive, since IF
amplifiers typically reintroduce noise on the unwanted sideband
detected by most product detectors. It isn't difficult to obtain
matched sets of crystal filters, if you have enough $$$.

Yes Virginia,

There is a Transverter Jack on the TS-430. It is an 8-pin DIN connector
used to interface a VHF or UHF transverter. (I am quoting the manual. I
never used it....)

Source record: 227525

Hi Dorr,
I've had a FT-101E for about 15 years and it's a great transceiver. I'm not sure whether or not it still exists, but for a while there was a "Fox Tango Club" on 20 meters (I think it was at 14,325 MHz) on Saturday mornings. That was a while ago, so it may no longer exist. Anyway the club leader sent out a newsletter crammed with modifications for the 101, and he sold the kits. For example, mine has a double balanced mixer in the front end (it really improves the reception),
a couple of crystal filters for CW, and a lot of other mods I can't remember right now. (I haven't been on the air lately, but am putting up a new antenna now and plan to get started again.)
I hope this helps a bit.

>only have one sideband to work with on receive.

Yes, indeed, it does cause a noticeable degradation in audio quality.
In the case of units like the 2010 which are primarily going to be used
to listen to commercial broadcasters, there is a good bit of benefit in
having a detector that can correlate both sidebands, though admittedly
for ham work, it's much less of a requirement.

But it basically comes down to how much audio degradation you mind. If
I am listening to a commercial shortwave broadcaster, I expect much higher
fidelity than I do from amateur SSB transmission. With SSB, I just want
to be able to make out the words. (On the other hand, I expect a lot
more from wideband FM broadcast, although I don't always get it...)

From: steuer@er1.rutgers.edu
Message-ID: <Apr.1.11.02.56.1994.28952@er1.rutgers.edu>
Source record: 227536

Hi all,
My friend has a newer 530, and would like to do the same mod I
did on mine, but he found out that his radio is "different" somehow
than my 530. How can one tell if it is different,(I think he said
serial # makes no diff), and what is the mod for the new 530 if any?
I would really appreciate any help on this matter, as my
friend is really interested in getting AM 118MHz receive which as far
as I know can only be heard after doing the mod, although he won't
mind listening to the state police on 800MHz either ;-)
Thanks!

>Thanks and 73. Maybe I'll meet you on the air, sometime.
I did own an FT411, I now own an FT411E.
I like the radio. The E model has a better receiver than does the older
unit, but $150 is a good price (I sold my old one for $175 with just one
battery pack).

I think you will be happy with the radio.

> Doesn't anyone *open* their equipment and look inside anymore?
>
> It's not like *this* part is made with multi-layered PC boards and
> surface mounted 100 pin componenets.

I share your sentiment, Jeff, but maybe Rob is better off NOT seeing the inside of an MFJ product - if he thinks that there is a properly assembled and connected tuner inside that box, and it seems work for him, then why subject him to the ugly truth? :+)#

In all seriousness, though, my MFJ QRP tuner (and transceiver as well) seem to work ok. I'm not thrilled to death with the tuner, but I can't complain.

So it goes.

Good luck and have fun, Rob. Longwires are lots of fun. I'm going to try out a random-length shortwire :) next week from my motel, while on TDY travel. QTH will be Reading, PA (not exactly exotic).

Looks like this is quite a rig, but does it do cross-band repeat?
Will it scan the same band in both halfs?
Does it have Remote control?
The Standard literature is lacking in details, or the radio is
lacking in features. Which is it. What are your experiences with
the rig? Thanks

I don't receive QST, I'm not a card-carrying ARRL member. I wouldn't know where MFJ is located in order to find their phone number. Also, I am generally unable to make telephone calls during weekday business hours, due to my job. What are Usenet newsgroups for, if not to ask a question or two from time to time, and to answer the questions of others? Wasn't this newsgroup formed for the specific purpose of helping people with equipment problems and issues, and for open discussion of same?

I have heard that hamcomm copies CW by tracking zero crossings and therefore does not work in noisey environments or for weak signal CW. Is that correct? I hope DSPMorse doesn't do it that way... doesn't sound like it from the title. Does DSPMorse use DFTs or FFTs or something else?

1008. Misc. Questions on Choosing a Dual-Band HT

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-02 07:27:46 UTC
From: mrw13@namaste.cc.columbia.edu
Message-ID: <2nj6pi$3hq@apakabar.cc.columbia.edu>
Source record: 227534
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

Last time I posted a question about buying an HT, many responses said to make sure to ask around here... so here are a few more questions:

What's the difference between the Icom W2A, W21A and W21AT?

What's the difference between the Standard C558A and C178A?

DJ-580T, IC-W21AT, TH-78A, C588A & FT-530 These five HTs were reviewed in last month's QST and as they all have various interesting features, I'm having a hard time choosing between them. To help differentiate them, I would like to know how modifiable they are. Can any of these models NOT be modified to pick-up aircraft frequencies? (Yes I know that two of them don't need to be modified at all.) Now could any of these be modified to receive cellular frequencies without getting bad intermod problems? And the last question, which of them can be modified to transmit on a commerical frequency? (I know that the FCC probably would not approve of this and that if I want scanning I should consider a separate scanner, but I do not want to have to carry an HT, a commercial radio and a scanner.)

If you have any other comments I would of course appreciate them greatly.

Thanks,

Marc Wollemborg

>like to limit the cost of the equipment/antenna to around $2000.

What dipoles were you told wouldn't work? The usual kind -- a wire
between two trees, with/without traps -- should work just fine. With
a 100' x 100' lot, you have room for up to an 80m single-band dipole
(134 ft). Or you could get a 5-band (80/40/20/15/10) trapped dipole
that'd require somewhere between 80 and 100 ft. A shortened 160m
dipole (using loading coils) would require about 100 ft. You can
get stuff like this all pre-assembled, ready to hang from your trees,
from a lot of places, including HRO. Check the ads in QST or CQ or
73. A couple places that specialize in wire antennas are the Radio
Works (804-484-0140) and Spi-Ro Manufacturing (813-646-7925).
Figure the cost of a preassembled dipole at $50 to $120; a bit less
if you assemble it yourself from parts (available from the same sources.)

Another alternative is a vertical. A lot of folks have mentioned
great satisfaction with the Cushcraft R7 (40/30/20/17/15/12/10m)
and R5 (20/17/15/12/10m) antennas. Figure these at around $350.

Re: the FT-990, this is a GREAT rig[Dg. I have one that I bought after
a lot of looking around, calling the manufacturers, soliciting opinions
here on the net, playing with different brands in the showrooms, reading
the reviews in QST (get the two volumes of collected reviews!), etc.
Right now, I'm still waiting for my ticket to show up (took the Novice,
Tech, General and Advanced about 7 weeks ago) so I can't try transmitting
but I can tell you the receiver's super. I listen mostly to CW and it
works very well to let you close right in on a signal, using the narrow
filters (get them!) and the built-in (great!) audio filtering. Other
advantages that attracted me were the packet & rtty modes (with separate
connnectors on the back so you don't have to plug/unplug the mike), the
10-key pad and the very fast antenna tuner. If you do decide to get
the 990, you won't be disappointed.

Well Keith, The easiest a least labor-intensive mod for this radio is to take it to your local amateur radio supply house, tell them your problem, and buy a FT-530.. BUT if you aren't prepared to do that (and I wasn't for a long time...) then get yourself a coat-hanger.. bend it into a modified "U" shape to fit around the back of the radio, put some type of rubber tubing on the ends where it will touch the radio. I used the plastic tubing used to keep screen in screened doors.. worked pretty well. It will take you a while to bend it into the right shape, but with some work you should be able to keep your light on indefinitely. And don't worry.. My light bulb lasted for the entire year that I ran my 470 like that.. Maybe they got smart and replaced it with an LED. Anyway.. Good luck and 73.

I second the opinions! I have a FT-990 with a GAP DX-VI. My lot is too
small to even put up a decent 80 meter dipole :-(
The only other vertical I have to compare the GAP against is an old
Hy-Gain 18-AVT that I bought in '77, and the GAP far outperforms it.
I also have a A-99 cut for 10 meters, which is a big improvement over
the GAP on _that_ band. With sporatic-E season coming up, the 10 meter
repeaters are a lot of fun. The A-99 vertical is nice to have if you
can find extra room to mount it, and can be had pretty cheap.

From: sprouse@n3igw.PGH.PA.US
Message-ID: <96@n3igw.PGH.PA.US>
Source record: 227541

I've just ordered an HTX-202 (on sale at Marymac Industries for $169) to replace my Icom IC-2AT. I have carried the Icom for years and one of the reasons that it still looks almost brand new is that is has a good fitting leather case. I'de like to have one like it for the 202 but the shack doesn't offer one. I plan to talk with my friends that target shoot and or hunt to find a local person who does holsters and such and get one made for it. If there is already some one out there doing this they would probably be cheaper. Please reply by mail, if there is interest I'll compile a list of vendors and post to the net. Thanks.

>QRZ, QRZ. That ain't me who said that!

It is me (NADO000) who said that. As confirmed by another post, a lot of people will buy a rig just by looking at a pretty picture. Some people's idea of trying a rig is to look at someone using one for 5 or 10 minutes. In many cases it is impossible to try the rigs you're considering buying side by side for at least an hour. In my original post, I tried the small Yeasu 890AT next to my Kenwood 850AT (with optional SSB filter, which BTW I use about 85% of the time). I spent many hours over a period of two weeks trying both rigs with a switch that allowed nearly instantaneous switching between the two of them (on receive).

Overall, the Yeasu sound is a lot better, and since I spend a lot more time listening than talking, this is what will influence my next purchase. Of course, the 850AT is quicker to use, is a little better at fighting strong QRM, has more memories than I need and can certainly do a whole lot of things I'll never need, but it also forces me to constantly use the RF control knob in cunjunction with the AF knob, so I can separate the voice from the background noise, especially on the low bands, where I like to hang out (40 to 160m) With the Yeasu, I never had to fool around with these knobs for nice, pleasant reception. I only tested the SSB mode of both rigs, mind you.

You can tune it by adjusting the length, checking it on the meter until
you find something < 1.5. Scribe that length into the side of the antenna
so you can find it again without the meter.

BTW, there is usually no need to cross-post so widely. I've set followups
to just rec.radio.amateur.antenna.

I'm not confused. I calculated the delays based on the graph you posted.
Delay equals the reciprocal of frequency times the total phase delay in
degrees divided by 360.

>The graph above plots phase, not delay. A constant delay results in
>a constantly-rising phase plot. For example, a 1 millisecond delay
>is 36 degrees at 100 Hz, 360 degrees at 1000 Hz, 3600 degrees at
>10,000 Hz, etc.

Yeah, but that isn't what your graph showed.

>While the plot above looks like a straight line, it really isn't because
>of the logarithmic x-axis.

Bingo! I check plotted it on semi-log paper then replotted on a linear
graph from which I calculated my differential delay numbers.

>However, as the chart that Tom Bruhns posted of
>a typical phase-shift network shows, it really isn't too bad. His chart
>shows that between 400 and 2786 Hz, the maximum phase error from a straight
>line varies smoothly between +17.2 to -20.9 degrees, which is far better
>than you would get with a typical transceiver-type crystal filter.

As I commented, his table looked much better than your graph, and I
calculated differential delays based on it too that were nearly 10
times smaller. It's just that I've seen phase plots for crystal and
mechanical filters which, *away from the edges*, where Tom's table
looked bad too, looked at least as good as Tom's phase shifter. And
note also that the network Tom modelled is not "typical", it is
considerably more complex than the traditional Dome based networks.
They tend to really suck in the differential delay department because
they're based on the same simple semi-log response as your graph. I
don't think he included an AF pre-filter in the table either.

I'll readily agree that the receiver type filters used in many ham rigs for SSB transmit signal generation, suck wind. But that's a different issue. Good filter designs are available, as witness filters we use for VSB video, and in certain telco FDM equipment that have a maximally flat phase response in the passband. We simply can't tolerate differential delay in video systems, yet we use filters instead of phasing to generate VSB signals. It's not a matter of economy, it's what works best.

This is typical. The dime sized speakers used in HTs and speaker-mikes
just can't deliver the volume you need in a car. Get an external speaker,
4-5 inch size, and plug that into the radio. You will then have audio
loud enough to annoy the kids with the boomboxes without objectionable
distortion.

Roger:

I have the same problem with my wife's 530. The problem seems to be with the speaker (or rather, the lack of it). When I plug the radio into an external speaker, there is more than enough audio. I guess that this is just another tradeoff to get the size down some more.

That depends on the details of the supply. You might need to add some
extra supply filtering to get rid of a ~15 kHz switching whine.

An issue that should be of more concern is the voltage and current
ratings. A 200 Watt supply may not be able to supply all of that power
at 12V. A typical PClone supply can put out 35 amps or so at 5V,
perhaps 1.2 A at +12V and 1A at -12V, and a couple hundred milliamps at
-5V. This would be a poor match for a linear amplifier that wants 20
amps or more at 12V. If your supply is something weird that puts out
gobs of power at 12V, perhaps it is a good match. That is unlikely.

A computer supply can reasonable for other purposes. QRP rigs can run
off the 12V 1A output of a PClone power supply. Put an appropriately
sized resistor across the +5V line or else the supply might not be loaded
enough for good regulation.

We are trying to make a regulated power supply (suitable for Tx) out of a computer power supply. It is made by RW, a German manufacturer, called a PC40 power supply, that will take 110-240 volts, rated at 220 Watts (Part # 380708-02)

Our question is: Is the DC ouput sufficiently regulated to provide clean RF output out of a radio? Also, can one bank two of these power supplies in parallel and use the combined output (400 W) to drive a linear amplifier?

Tnx in advance

Hi!

I'm looking for crystals for some of
my older ham radios:

Heathkit HW-10 6M AM (Shawnee)
50.300
50.400
(anything else?)

Drake TR-22 2M FM
146.520 simplex
146.580 simplex
146.925/146.325
146.970/146.370
(anything else?)

Also looking to trade computer equipment
(including memory) and misc. electronic
equipment for scanners, ham radio, SSB CB,
etc.

Please Email to: RobB873302@aol.com

THANKS! - Rob

1030. Trouble with SW bands on Drake R8 Receiver

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-04 05:12:29 UTC
From: hugh@hodain.ci.net
Message-ID: <HUGH.94Apr4001229@hodain.ci.net>
Source record: 227458

Hello all,

My infirm father-in-law has a Drake R8 Communications Receiver which he has been using for a couple of years to scan the short-wave bands. Recently, he has been unable to receive anything on the SW bands, even though other bands are apparently ok. He believes his antennas are not to blame since they work for the other bands. So, (hastily) he's concluded that a lightning strike has "taken-out" his SW tuning section, and he's preparing to pack up the unit and send it back to the manufacturer for a repair.

Before he gets stuck with shipping and repair costs I'd like some feedback from other users of the Drake R8 on the possibility of other reasons for the failure on the SW bands. According to his wife, there hasn't been an electrical storm since the SW bands were last coming in; she wonders if the problem couldn't be simpler. And, though aware of the quirks of lightning and high-voltage spikes, I too am slightly skeptical that only one section of the receiver would be wiped out. Perhaps the problem is not so serious as to require a factory repair.

Any relevant information about common failure modes of this unit, user bewares, horror stories, etc will be appreciated. Though not a ham, I'm handy handy with electronics and could easily perform a few tests with the cover off if needed.

E-mail or news is fine.

Thanks very much in advance.

I keep hearing wonderful things about SGC's automatic antenna tuner.

QST liked it. The on-the-air reports are glowing, from the couple of happy customers I've worked.

As a solution to get the feed point of my multiband wire antennas out of the shack, and to get the most out of a broad-banded rig running barefoot, it seems like a match (ahem) made in heaven.

Does anyone have anything *bad* to say about this beastie?

Greg

1033. Proper wire to connect a key?

Okay, real dumb question. (Except that I'd feel even dumber if it turned out this isn't a dumb question and I should have asked! :-)

I've just bought a Bencher iambic key. I was a bit surprised to see they didn't include any wire with it. Offhand, I assume any reasonable 3-conductor wire can be used, right? I'm guessing it's just low voltage low current (logic levels) DC involved, so not even any reason to use a shielded cable, right? Just any decent, flexible light cable should work, I'm assuming.

Correct me if I'm wrong, please.

I don't have my power adapter handy, so I can confirm if its the same part
number. But the unit is rated to do 12V 1Amp. So it sounds the same.

If it is, the answer is no. You can use this supply to run the radio as
receive only, but you get 60 cycle hum in your transmit audio. You might get
away with low power, depending how low the HTX202 goes. I tried it on my
Yeasu FT530.....I could sneak by with the HT on 0.5W, but any higher didn't
work.

What you say is true enough if there were no RF around. But since the whole idea is to operate a transmitter, there IS RF around. Hence you need to use shielded wire to prevent the RF from your transmitter from fouling up the operation of your keyer.

Hi,
a friend of mine asked me to post this for him. He just bought a
Kenwoord TS-50 HF
"mobile" rig for his 1993 Ford Explorer. He's getting a white noise that
is only present
when the engine is running. He's using a vertical antenna on the roof of
the car. The
noise is contact over all the bands and does not waiver with engine RPM.
It is gone when
the engine is off. Sniffing with a loop antenna has so far been
inconclusive. If there's
anyone with experience with this sort of noise, especially on Ford trucks,
please let me know

I'm running an IC-737, currently without the optional filters. I'd like to add the filters, but I'm wondering which to get? I have a choic of narrow or wide (both of which are narrower than without the optional filters), and a choice of 1st or 2nd IF (7 Mhz and 455 KHz, I think).

Is there such a thing as having too narrow a filter, or should I go for the narrower ones?

If I go with only the 1st or only the 2nd IF, which is better? Would it be better still to get the filters for BOTH IF's, or is this overkill?

Thanks,
Chris Moore

If your going for CW filters and have a choice of 250 or 500 Hz I would
go with the 500 Hz. 250 Hz filters are nice but a bit narrow for
everyday operating.

: If I go with only the 1st or only the 2nd IF, which is better? Would it

If you can only put one filter in the receiver put it in the IF closest to
the front end of the receiver (1st). That will keep unwanted signals out
of the later stages of your receiver. A pair of filters will give you VERY
steep skirts. I personally prefer having both filters. CW is a whole new
ballgame with good filters.

I got the shop manual for the R8, and there's no direct correlation in machine organization to SW bands in particular.

There are 11 bandpass filters, but the divide up the frequency coverage of the Drake for all of 150 kHz - 30 MHz. But if his 'favorite' band(s) fall(s) under the range of one of the filters, I'ld say you have a place to start.

If I think of it I'll try to look up the the filter ranges and post the info.

I need to find a couple of radios for my repeater system. I really need
something that can work in the 420-430 link band (US).

I would prefer a MVP or something else very small (I have little rack space, so
a EXEC II would be too bug :-(

So how about it? Any one have a source for these?

Thanks!

>a shielded cable, right? Just any decent, flexible light cable should
>work, I'm assuming.

Oh, dear. Remember that your keying waveform is a square wave with
varying duty cycle. A squarewave is made up of all odd harmonics from
the fundamental up through infinity. You need to use oxygen free copper
Monster Wire(tm) to avoid distortion of the dynamics of the waveform.
The cable must have 8 twists per inch to achieve the proper pitch.
(Experiments were conducted with 7.5 twists per inch, but there was
a large pitch shift over the length of the cable.) Gold connectors
are required, attached to the cable by pressure bond to avoid any
chance of oxygen contamination of the copper. (Copper oxide is a diode,
and will cause spurious harmonic generation.) I can sell you a nice
set of pre-terminated cables for only $99.95 plus shipping and handling.

:-) :-) :-)

Really, the only concern you may have is RF pickup. In that case you'd
want to use shielded wire. Standard shielded pair audio cable works
fine. Connect the shield to the paddle, and one of the pair wires to
each of the dot and dash contacts.

Gary

Me too !

I need crystals for a GE slimline style handie-talkie. I need 151.625 and 151.925 Mhz. These are land mobile freqs. The radio had a small style Bomar crystal with 154.600 stamped in the side. The crystal had gold wires for leads and plugged directly into the PC board.

Where do people get crstals nowadays? I went to the ARRL hamfest in Maryland this past weekend and couldn't find *anyone* who had crystals for sale. Boy, have things changed. What do people do with all the surplus xtal controlled HT's I saw for sale at the hamfest?

Enough raving. Any help would be appreciated.

Deserved.

>Does anyone have anything *bad* to say about this beastie?

If you have a close to resonant (but still bad match) antenna, the tuner can search till the cows come home, rattling away mindlessly at it's relays. A manual antenna tuner with cross-needle display takes about a minute to tune up on a fresh antenna and comparitively can match *anything*, which the SGC tuner can *not* (but damn close in any case). Only purchase this if you want hands off tuning desparately, I believe this tuner is the best on the market, if you prefer to run long wires in the middle of nowhere, bring along a manual tuner *just in case*.

If your aligator clip slips off the antenna feedline while running with the tuner in the shack, be prepared to watch in horror as your tuner matches up the short little alligator clip wire on 160M, then promply starts a lightening burst and fire ball from the arcing ... ;-/

The tuner does *not* retune if it has better than a 4:1 match after switching bands, you will need to reset the power to the tuner before it will tune up on the new band.

Hi,
just wanted to point out the the 830 does not put the carrier out when the key jack is inserted in the rear panel, the mode is CW and the SEND/RCV switch is operated.
In this case, infacts, the switch can only be used used to control the T/R while the actual transmission is controlled by the external CW key or electronic keyer provided that the VOX control is activated.

: I keep hearing wonderful things about SGC's automatic antenna tuner.

I am using the Yaesu FT-840 with its matching remote antenna tuner. It looks and acts much like SGC's, with it's clattering of relays as it searches for a match. My friend used his similar setup mobile, with a 102" CB whip as a "long wire", worked mostly 40m and got great reports. Folks about 100 miles away could not hear much difference between this setup and his 40m dipole.

I use the above system at home; the automatic tuner sits close to the rear wall of my house, connected to a outdoor 30 foot random wire. I can load AND WORK OUT on all bands, including 160 (which was a big surprise to me).

Perhaps there are some operational difference between the SGC and Yaesu automatic antenna tuners; I'm not sure. But I certainly have had good luck with the Yaesu setup.

Gary Coffman (gary@ke4zv.atl.ga.us) wrote:

: Now this is much better. The ends are horrible of course, but in the
: region 600-2400 Hz there is only a delay delta of 0.014 ms. That's
: hardly audible at all to someone with *good* ears.

For some points in my table, I get the following approximate group
delays:

Freq, Hz Group Delay, ms
200 1.09
400 0.57
800 0.31
1600 0.15
3200 0.07

Dunno how Gary got 14 microseconds; you'd have to have better-than-
golden ears to hear that, from reports I've seen. Anyway, the numbers
in the table above are from

group-delay (seconds) = d(phase [radians])/d(frequecy [radians/sec])

As expected, they go essentially inversely with frequency.

: I'd note that this
: matrix phase shift network is considerably more complex than typical
: networks found in older phasing type equipment. And as Richard Karlquist

I recall having the values used in the B&W phase shift network around
somewhere, but couldn't find them. I wanted to put that into Spice
originally, cuz it would have been a lot simpler than that "matrix"
network. Can someone supply the values? I'd be happy to run them
for comparison.

From: rossi@VFL.Paramax.COM
Message-ID: <1994Apr6.194058.28700@VFL.Paramax.COM>
Source record: 227487

Asking this for a friend...

The local police/fire are starting to move into the 500 MHz band. My friend is considering buying an Icom W2A. He is trying to determine if the W2A can receive anything at 500-512 MHz?

The Icom W2A (after doing the extended receive mod) will allow you to enter just about any frequency on the keypad but will only actually receive in certain frequency ranges.

On UHF the normal "extended receive" coverage is around 400-500 MHz but some have been known to go slightly above 500 MHz. I have an IC-24AT and on a good day it might make it to about 501 or so...

Is the W2A the same? How far above 500 MHz will they actually receive?

Source record: 227490

I need some help from this group please.

I have been studying for the past several months. Last month I took all five written examinations and 5 wpm code and passed all of them. I am ready to take 13 wpm code exam this month and am hoping to be up to 20 wpm within the next month or so. My wife is studying to take novice/technician exams, and three of my children are learning code and studying to take the novice exam. We are all very excited about getting into amateur radio.

The question I have is this:

I would like to purchase a HF transceiver but which one? I have had no experience using HF. I am not sure which options I would be interested in because I have not had any experience with them. I would rather spend a little bit more now and get a transceiver that will be able to support future interests that I might develop as I get more familiar with amateur radio. I have been looking at a number of magazines to review a variety of transceivers but still have questions as to which to purchase as I have not been able to try out any of them. I don't know anyone that I can approach for help.

I have read about the Yaesu FT-1000D and the Kenwood TS-950SDX transceivers and they at least appear to have a lot of features that seem nice but also somewhat overwhelming at first glance. I am able to afford a transceiver in this price range but would like some help from this group. If you have had experience with these two transceivers or others similar that you would recommend could you please E-mail me your feedback/recommendations. Any help would be greatly appreciated.

Thank you very very much for your help. I have really appreciated the positive information available in this group.

Another interesting case is to start with a conventional elliptic function
bandpass response, then proceed to the two networks with flat group delay
and 90 degree phase difference, keeping the nice elliptic magnitude response.
The finite jw-axis zeros may well wreak havoc -- with the number of poles
and zeros (for the same overall tolerances on amplitude and phase errors as
you have above) increasing significantly.

My suggestion: buy a quality mid-level used HF rig and find out what interest you on the bands and what the features are that you like to use.

Look for ads in Ham Trader Yellow Sheets, or rec.radio.swap etc.

Then sell the radio after you buy the rig you actually want and have experience to judge from.

Have fun. Perhaps the used rig will be just what you need.

I have a friend who had a service monitor and have been wanting to hook up
my W2A to it and see how it performs from 100MHz-1GHz, but havn't had the
time. When I do, I'll be sure to post.

The entended receive and transmit specs will vary from radio-to-radio. I
would expect that most modified W2As could receive 410-480, but it'll be
pretty deaf in the 480 range and above. At 460MHz my rig measured 2.0uv for
12db SINAD. In reality, I have no problems receiving those transmissions, but
that spec is rather poor. I wouldn't expect most W2As to receive over 500MHz,
nor would I buy one if one of my primary uses for the rig was to receive over
500MHz.

Roger is right.

There are a LOT of HAMS with more money than brains. You find their rigs for sale in the yellow sheets all the time.

You can get a hell of a lot of rig for half the price of those two. I personally believe that with the SDx and FT-1000, you are paying a premium to own the "top of the line" radio from the manufacturer.

I would be very surprised if those rigs give $2,000 MORE satisfaction.

73 es good luck =paul= wb8zjl

1071. Snap-on Ferrite cores (TNX Phil)

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-07 13:58:18 UTC
From: henrys@netcom.com
Message-ID: <henrysCnw6t6.FJA@netcom.com>
Source record: 227399

Thanks Phil, I had forgotten about this.

These little snap-on ferrite cores can cure many a mobile rfi problem.

I have gotten rid of interference and alternator whine with them.
They can be installed in a power line without having to disconnect
the line.

Radio shack sells them and MFJ also sells a package of 4.

1072. Best Dualband HT?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-07 15:46:04 UTC
From: DAVID_SAMPSON@QM.IS.LMSC.LOCKHEED.COM
Message-ID: <DAVID_SAMPSON-070494083259@129.197.87.38>
Source record: 227414

I am preparing to buy a dualband (2m/440MHz) HT and have so far been unable to make up my mind about what the "best" HT is. It is worse than buying a 486 clone. I am considering the Yaesu FT-530 (love the keyboard/display and especially the accessory mike with readout/keypad), ICOM's W2A (like that extended receive, but don't like that non-lit keyboard), the Alinco DJ580T, and the Standard C528A (don't like the lack of extended receive, but I have been told that this purpose-built unit has the lowest susceptibility to intermod as a result).

I talked to about a dozen HT owners, and have obtained a variety of opinions. The dealer tells me that dualband is the only way to go, but since I live in what is reputed to be repeater heaven (a.k.a. Silcon Valley), a 440 MHz single-bander would probably take care of my communication needs. I have also been told that when one gets out of major metro areas, 2m repeaters are a lot more common than the 440 MHz variety. (But I have also been told that when in the "boonies", a lot of hams will not talk to you unless you are one of the regulars).

So, with that as prelude, I solicit you opinion regarding what the best dualband HT is, and if dualband is really necessary. Thanks in advance.

1073. Wanted Kenwood TM-742 Mods

Source record: 227401

I don't know what to do, or where to post.

There is a major interfearance problem on a business
band here in philadelphia. When Our system is trying to talk
at night, the other people using the band try also to talk.

Without naming either business, is there anywhere someone
can point to so I can do a search for their liscence for their
repeater, (which has gained signal strength majorly in the last month
or so) so I can see what they are liscenced for in terms of power
output and height of repeater?

thanks, and if anyone can do it, it is a college in phil,
on the frequency of 462.000 (rx) 467.000 (tx)

Thanks. All help is appreciated, as we let them talk, but they
don't let us talk.

Thanks.

: you have above) increasing significantly.

If you look at this a little differently, it's easy to see that the number of poles & zeros shouldn't be significantly affected. Come up with a pair of filters for quadrature phase that you are happy with for amplitude and phase matching. Add the same zeros and/or poles to both. Then the amplitude and phase matching will be unchanged. However, it should be easier to put the frequency shaping outside the quadrature phase network, since it can then be guaranteed to be identical for both channels. Leave the quadrature network all-pass; if you wish, shape its absolute phase to compensate the frequency-shaping filter. At least, that is how I'd approach it if I were constrained to do it analog.

Here's one cheap source for split cores...use the split cores from the
focussing coils on junked CRT's. Of course you have to spend a while
getting all of the wire wound on them off. I don't know what kind of ferrite
material is usually used, but it seems to work fine for most rfi problems.
One advantage is that these cores are bigger than some of the ones
sold for rfi purposes, so you can use them on larger cables.

1077. RE: Comments on the ICOM W21AT

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-07 17:40:01 UTC
From: gianotti@aol.com
Message-ID: <2o1ghh$ka3@search01.news.aol.com>
Source record: 227404

I have both the ICOM W21 and the Yaesu FT-530. The ICOM display is harder to read, the keys are much smaller, the recieve audio (with the built-in speaker) is much worse, the display and the keypad don't even come close to lighting up as well as the Yaesu at night. Other than that both radios are compariable.

Hope this helps.

From: gianotti@aol.com
Message-ID: <2o1gqu$kbt@search01.news.aol.com>
Source record: 227405

Mine works fine out of band after doing the keypad mod. However, I feel the Yaesu FT-530 is a much better over-all handie talkie. The Yaesu has a much better display (both with and without the built-in light) it has better audio with the built-in speaker (better is realative as both have such small speakers that one could not consider the audio great), has larger keys and just is an all around better rig.

Chris,

I have owned a Kenwood TS-50S for about a year now. It has been
a VERY solid rig. I am extremely impressed with the radio. By prior
radios were a Heathkit HW-100, Kenwood TS-120S, and a Kenwood TS-440SAT.
The performance is as good as if not better then the TS-440. My primary
operations in the last year have mostly been mobile and that is where
the TS-50S really shines. It is missing some of the "nice" features
that the bigger rigs have such as RF gain, Notch Filter, SSB Filtering,
Full Computer Control (it has "partial" computer control), and VOX. To
tell you the truth, I never really used them on my older rigs, though!
I do miss the internal Antenna Tuner of the TS-440SAT, and since I have
an external tuner I didn't buy the AT-50 External Auto Antenna Tuner.

My overall impression of the radio is that I like it a lot. I might
try to trade for a larger rig if my operating conditions change from
mostly mobile to mostly base station.

If you have any questions about the radio. Feel free to contact me
directly.

I think the key phrase is "shape its absolute phase to compensate the
frequency-shaping filter." I didn't explain the situation I had in mind
very well. Let me try again.

Suppose the system has been realized with a conventional all-pole bandpass
filter such as Chebychev or Butterworth for the amplitude shaping, followed
by all-pass networks to flatten the system's group delay and get the
90-degree phase difference. The 90-degree phase difference and flatness of
group delay are just within certain tolerances.

Now you decide to improve the amplitude response (better shape factor) by
changing the bandpass filter to the elliptic version, with the same number
of poles but additional jw-axis zeros. You try to readjust the all-pass
networks to restore the flat group delay and the 90-degree phase difference
to within the original tolerances.

My conjecture is that this cannot be done without adding more all-pass
pole-zero pairs. If the group delay is within tolerance, the 90-degree
phase difference isn't, or vice-versa.

1087. Programming Kenwood TS-610 for 6meters

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-08 02:09:33 UTC
From: dino@cam.org
Message-ID: <dino-070494210933@dino.hip.cam.org>
Source record: 227413
Cross-posted to: rec.radio.amateur.equipment,

A friend of mine has picked up 3 Kenwood TS-610 commercial 50Mhz mobile
radios.
He has tried to get them reprogrammed for the amateur bands but the dealer
said that his programmer (for the PROM) could not allow him the enter
frequencies in the ham bands.

Does anyone have any idea or way I could program the PROM with a modified
program or programming it by hand using a PROM or EPROM programmer.

Thanks, Dino.

I use a G5RV. It looks something like a center-fed dipole except that
where the center-fed feedline is connected actually is part of the
antenna and so it is 'T' shaped. The feedline that feeds off the bottom
of the 'T'. I have it set up so that it looks like an inverted V dipole
and the ends come down to about 10 feet off the ground. It works very
well and tunes up on 80,40, 20, 15 and some of the WARC bands (I make
the statement about the WARC bands not that I have them but a friend
who has the same antenna does and he can tune thos bands). The antenna
is home-brew and so you can make it with relatively little expense.
Anyone interested, send me some e-mail

>ch tech license. Any information would be great..

These are both good radios, and at their sale prices, they're good buys.
They can scan, several different ways, but *only* in the ham bands. These
radios have narrow tightly filtered front ends to reduce the typical intermod
and overload problems from out of band signals that the wideband HTs on the
market suffer. If you are looking for a wide coverage scanner, complete with
birdies, images, intermod, and overload, then the Radio Shack radios aren't
for you. But if you want a solid ham bands only HT that won't suffer the
many ills of wideband scanning HTs, then they are a good choice.

If you don't want to homebrew, AntennasWest has decent prices on
the G5RV which include insulated, weather-sealed wire, center insulator,
end insulators, black dacron support rope, and a precut length of 450
ohm ladder line with a preassembled PL-259. The whole antenna is black
and unobtrusive, and they sell full-sized versions for 80-10 or half-
size for 40-10. Just connect exactly 70 feet of RG-8X coax to the
end of the ladder line and, with an MFJ-941 or equivalent tuner, you
can tune and operate all bands (including WARC). I use mine mostly
on 30 and 40 meters (ocasionally 80, 20, and 17) and it works great!

>Richard Harris
>waiting for the FCC

Oh, boy! Deja vu all over again!

In high school 25 years ago, I used to be interested in SWL but never
went on to get ham license simply because I had absolutely no money
to do anything. Thru college and afterward, other things distracted
me. Then last fall, my interest was stirred up again, and happily,
I found I could afford it this time around :-), so after studying
like crazy for a couple months, I took my Novice, Tech, General and

Advanced tests Feb 7. Hopefully, I should hear back from the FCC in another few months. :-)

I went thru exactly the same dilemma re: choice of a rig. For me also, price wasn't nearly so important as finding the rig I'd really be happy with. (I commonly find that a year after I've bought something, I've completely forgotten what I paid but am still acutely aware of whether I got what I wanted!)

What was helpful to me was to buy the two books of collected reviews from QST published by the ARRL. You'll find reviews in there of virtually all the rigs you might reasonably be considering. At $15 each, this is cheap, cheap, cheap considering what you're about to spend on a radio.

Also, I found it helpful and illuminating to call the vendors and ask "why are you better than the competition?" If your experience is like mine was, I think you'll find the responses will be a lot more telling than you'd expect! Icom was a BIG disappointment here. I called _numerous_ times, had a terrible time ever getting a real live human, kept leaving messages saying I've got several thousand dollars I want to spend, so please send me literature and let me talk to somebody. No response. I finally did get to speak to a fellow who could only offer, as the reason to buy Icom, "because of the receiver." (Yeah, but _what_ about the receiver?) No literature ever appeared for several months -- not until almost a month after I'd already purchased a Yaesu!

Yaesu was a very different story. When I first called and said I was interested, they immediately sent me an enormous packet of information including even goodies like world time zone and call prefix maps, etc. Later, when I called back and said I had some detailed questions about the CAT (computer control) interface, they put me right thru to a fellow who was fully prepared (and did!) answer every question I had about how the opcodes and results were encoded, etc.

Talking to the dealers was also very helpful. I called probably a dozen selected out of QST, CQ and 73 and asked for their recommendations generally and also some specific questions: Which brands and models sell the most? (If it's a popular rig, I figured that might limit my downside if I changed my mind and wanted to sell it.) Which companies seem to be most responsive for parts and service? If I buy X today, what will it be worth a year from now as tradein on Y? Etc. Again, very consistently, Yaesu came out ahead of Icom and Kenwood. Icom seemed to be viewed as certainly a quality supplier with a good cachet to the name but somewhat more expensive and less agressive than Yaesu. The Yaesu FT-890, 990 and 1000 radios were _always_ identified as the most popular rigs in their price classes. Several dealers told stories of Yaesu going beyond the call of duty to provide service and support. None of the dealers seemed especially thrilled with Kenwood. That consistently seemed to be the lowest volume brand. Also, several dealers commented they thought the Kenwood units were somewhat more difficult to use.

One day I drove up to the Ham Radio Outlet store in nearby NH and basically just parked myself in front of their demo units for the day. That helped a lot to actually get a feel for the physical characteristics of the units. How big is each one? Do the controls really seem to be laid out the way you'd like? I actually went in thinking I might go whole hog for an FT-1000 but walked out impressed with the compact, well thought-out layout of the FT-890 and with the audio filters on the FT-990 (which are _very_ effective on CW.) Seeing it in front of me, the Icom 765 actually seemed a bit dated in design (I'm talking partly cosmetics, but okay, that is a factor). The Kenwoods did turn out to be more difficult for me; the controls did not seem nearly as intuitive and I lost patience with them. Also, there in the store, I got a chance to look at the manuals and that also was helpful.

It was also useful to just call some local hams. Some folks may be a bit aghast at how brazen I was, but what can I say? This is me. I didn't know any local hams but I did happen to notice a mention of a K1EA CT program in the HRO catalog (the mention was that the Yaesu radios were compatible). I didn't know what that was but I looked up that call and discovered it belonged to Ken Wolff, who lives in nearby Harvard, MA. So I got his phone number from information and called him! Turns out he's a genuinely nice fellow who not only spent quite a while talking with me, answering a lot of dumb questions but also pointing me at some other local hams. Conversations opened up with the question, "how do you choose a radio and antenna", often led to some very useful discussion. My point is not that you should call Ken Wolff, but that you should consider being a bit brazen about your approach to finding other hams in the area and not be shy about going up to folks you don't know and asking for advice. The worst that can happen is they say no.

Finally, posting questions here on Internet as you've done, was very useful. After the day at HRO, I was actually leaning toward the 890 based on that small size and also because one fellow had been making me feel a bit "guilty" about considering a top-end rig as a rank beginner. What came back were a number of very positive comments about the 890, but also some pointed remarks that if cost wasn't the driving factor, the 990 was a hell of lot more radio with its 10-key pad (yes! that does turn out to be useful!), separate connectors on the back for packet and rtty (so you don't have to plug & unplug the microphone if you want to get into that), additional filters, etc.

That caused me to try laying out my alternatives in a spreadsheet, showing the costs of the various configurations for the 1000, 990 and 890 that I might consider. One big problem with the 890 that's easy to overlook until you add up the numbers is that you need a separate power supply, for example. Once I had it in the spreadsheet, it was clear that the 990 was about 20% more expensive than the 890 but obviously a lot more than just 20% more radio. The 1000 was 1/2 again more than the 990 but not clearly 1/2 again more radio (in my hands :-).

At that point, it became fairly clear that for me, the Yaesu FT-990 was the best choice. And indeed, in the two months I've had it, I have been totally satisfied that this was a very good choice. At the same time, I hope I make it clear that what's a good choice for me may/may not be the right one for you. But I do hope knowing something about the search path I followed may help you develop your own strategy.

Good luck!

Oh, one other thing: when you pay a couple thousand dollars for a rig, they're _all_ good. :-) The problem is just picking the one _you_ like best.

Joe,

I recently ordered some crystals from JAN Crystals in Ft. Myers, FL. They
can make just
about any crystal you need. They probably can make the exact one for your
rig. I don't have
the phone number but here is the address. They usually have advertisements
in QST or
73 mags too.

1093. FOR SALE: KENWOOD TM-241A 2m mobile

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-08 18:26:21 UTC
From: steinr@ucs.orst.edu
Message-ID: <2o47kd$iv4@gaia.ucs.orst.edu>
Source record: 227421
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

FOR SALE: KENWOOD TM - 241A
WARNING: Do not be fooled by imitations! Read this:

This radio is only 4 months old off the shelf. Perfect working condition!
I only want to sell it to upgrade to a dual band.

The radio has the following features:

Extended Frequency coverage:
Receives from 118MHz to 174MHz
Transmits 144-148MHz
IS modified for MARS and CAP transmit

Power Output:
high - 50 watts
low - 10 and 5 watts

20 multi-function memory channels and a call channel
Multi-Scan capabilities
Easy to read illuminated keys and a large LCD display
DTSS
Pager function (need DTU-2 unit)
CTCSS tone encoder AND DECODER
Auto power-off with warning beeper
Tone alert system with elapsed time indicator
Time out timer
Triple lock functions
Option digital recording unit (Would need to add)
Auto repeater offset
ALT
Repeater reverse switch and offset switch
Multi-function microphone

Radio costs over $360 new with Decode unit installed.
Am asking $300 plus shipping. Might consider paying
shipping.
Radio is still within warranty period too.

Please e-mail responses to me at steinr@ucs.orst.edu

I agree with Roger. I've heard that there is a saying among
amateur astronomers: "Don't build your last telescope first".
I guess an analogous statement with regard to ham radio is
true too: "Don't buy (or build) your last rig first".

>I've experienced no problems at all. So far, I've run it up to 25 watts;
>the antenna cable runs away from the passenger side of the car (where the
>computer is located).

I agree. I recently installed an FT-2400H in my 1992 Honda Civic 4-door.
I can run 50 Watts all day with no trouble or funny operations on the
dashboard/wipers/radio/clock etc.

I ran 14 guage wire directly to the battery through the air conditioning
condensor drain grommet (room for the wire and the drain) on the passenger
side. Low loss Comet coax runs to a 5/8 wave Comet antenna on a trunk-lip
mount. The radio is mounted almost vertically on the passenger side of
the center console.

Same installation on my 1991 Toyota Tercel 2-door. No problems.

I've heard horror stories from others, Keep the radio and coax away from
the ECU. DO NOT use the vehicles electrical system. (Don't connect to
the cigarette lighter or fuse block.) Go directly to the battery and
you should be OK.

> AL N1AL

Umm... true. But the overall group delay is affected. There is an offline discussion going on on this. The essence of it is that the finite zeros out of the passband by themselves don't affect the phase (certainly true) but the somewhat different pole positions have an effect of to-be-determined significance. Stand by.

I have a Kenwood TS-450 which has been on the boat for 2.5 years now
and has worked out fine as has the SGC-230 tuner.

I would recommend the new radio by SGC that is both a marine SSB
and Ham Radio. Although I hold an Advanced license, a number of
friends currently out cruising are not ham licensed and use the
marine SSB frequencies for scheduled contacts, etc.

The Kenwood has a number of 100 memory registers which has been
great for storing net, WXFAX, BBC, etc frequencies.

If any post needed a warning to proceed at your own risk,
this is is. That said . . .

It seems there are many of us in the market for a dual
band HT with extended RX so that one can be mobile with the
greatest amount of RX capability and the fewest number of
units. My summary of what's been offered is (no hands on
experience with any units) is . . .

The suggested models are
QST (March 1994) reported
typical sellling extended RX
price (from various
mod files)

ICOM W21AT 514 50-999
Standard C558 529 100-199,300-500,800-999
100-173,342-471,823-990 (PLL lock)
Yaesu FT-530 439 110-180,300-500,800-950
Alinco DJ-580T 409 ???

The DJ-580--or Alinco, rather--gets mixed reports. Some
really like their units. Others report of (or of hearing of)
bad experiences wtih the 580. It's the least expensive of the
lot. One ICOM/Alinco dealer told me the 580 has the less
tight front end and would not be as suitable in a high RF
location.

The Standard, already the most expensive to begin with,
requires an extra CTCSS unit. Extended RX is a keyboard
function.

The FT-530 is less expensive and has a slide out lithium
backup battery. Extended RX is a hardware mod.

The W21AT has the widest range of extended RX.

Some questions remain, however. There have been reports
that the wideband reception in these units limits their
abilities as scanner-replacements. (Unfortunately, since
these capabilities are undocumented, they are not even
mentioned in comparative tests such as QST's.) Is this really
the case? Are they much worse than a low end scanner?

I started out leaning toward the Standard (built like the
proverbial battleship) but was put off by /having to get CTCSS as

an addon.

I am now undecided between the Yaesu and the ICOM but am
leaning toward the ICOM because it *may* be able to serve as a
poor man's monophonic walkman (88-108Mhz reception).
Can an owner comment?

There is another question I'd appreciate an informed answer to.
There are a few extended RX channels I'd like to scan on occasion
and would devote a few memory locations to them. Presumably, the units
requiring the hardware mods would be able to remember the frequencies.
Would the ICOM forget them? I assume the extended RX must be reentered
each time the unit is turned on, or is the unit smart enough to
remember them, even though they're extended frequencies?

(All comments and corrections--even flames--gratefully appreciated.)

1105. ATTENTION - Icom IC-W2A owners

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-09 22:41:38 UTC
From: rossi@VFL.Paramax.COM
Message-ID: <1994Apr9.224138.5523@VFL.Paramax.COM>
Source record: 227433

I have a question about IC-W2A wideband receive.

A friend bought a new W2A this morning (Sat 4/9). When he got it home
and hooked it up he did the wideband receive keypad mod (3 # B ON).

It will "tune" above 450 and below 440 just fine but he can't *hear* anything
above 450. My IC-24AT sitting right next to his W2A (with same rubber duck
antenna) is picking up local police, etc in the 453-454 range like crazy
while his W2A is silent.

If he sets the squelch right on the threshold at 450.000 the receiver stays
quiet below 450, but at 450.005 and above there is a faint buzzing sound
in the background. This buzzing sound is through the entire 450-500
range. It seems to hear 800 MHz OK. The exact same thing happens when
he tunes below 440.000 MHz. The buzzing starts at 439.995

At first we thought there was something wrong with the radio so he took it
back to the store (HRO Delaware) and they gave him another one that *appeared*
to work OK in the store (real fast check) but after getting home he finds
that the second radio is acting exactly the same. (?)

The problem sounds almost like local interference however, none of this
buzzing sound is detected on my IC-24AT sitting 3 feet away - same antenna.
We took his W2A out to my car an put in on my mobile antenna and we could
hear a few Phila police calls around 453 MHz in the noise on the mobile
antenna while I was hearing them full quieting on my IC-24AT with the
rubber duck.

He plans to call Icom first thing Monday morning since a few days prior to
this he talked to someone out there who said there would be no problem
receiving 450-470 MHz with the W2A.

Anyone else ever experience anything like this with a W2A?

Well, I'm currently waiting for my Tech license, and I purchased a 2M (HTX-
202) for the great occasion... Listening to it, it seems to be fine, but
I won't know about broadcasting until I get my license <G>! I did notice that
the sensitivity is a little higher than some other models (about 0.25uV 12dB
SINAD)... However, it picks up the repeater outputs here in Birmingham
pretty well...

1107. need help with Harris Alpha 40 IMTS radio telephone

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-10 02:30:23 UTC
From: bruce@pixar.com
Message-ID: <1994Apr10.023023.8237@pixar.com>
Source record: 227435

At a hamfest I picked up a complete Harris Alpha 40 IMTS radio telephone
and 4 spare "radio" units. The radios appear to be 450 MHz full-duplex.
The duplexers, power amps, and preamps in these radios appear to be easily
salvagable for Amateur service. The radios appear to contain two independent
frequency synthesizers. There is a small PROM that probably contains the
phone number and the list of accessable channels. The operation manual
has instructions on how to use the phones in "simplex" or duplex mode
for direct mobile-to-mobile communications as well as in "automatic" modes.

Before I part down these radios, I'd like to see if there is any chance
of converting them to Amateur service. I don't know all of the connections
necessary to power up these units - the power cable contains a red, green,
and a white wire, and there is a fused red wire coming out of the handset
cradle along with other wires. I tried the obvious combination using a 3 amp
power supply (not powerful enough for transmitting, I know, but safer than
connecting it to my 50 amp one) and was not able to get the phone to light up.
Has anyone seen the service manual for these units? How versatile is the
synthesizer? Any hope of using one without the handset?
The software for the phone is contained in a socketed 8035 and EPROM.

Can someone make me a copy of their Harris key? My Motorola and Aerotron
keys won't open these radios, and some of them still have the covers
attached.

Thanks

Bruce Perens

>won't modify. Does anyone know if it can be modified???? Also, what do you
>think they are worth today???
>
Yes the PCS-2000 can be modified for CAP/MARS. Although I have not
tried to modify mine, I do have the instruction sheet from
Amateur Wholesale Electronics. If you do not need a crossband split,
you need to run a jumper from pin 13 of the TC9122 to the green wire
on the plug-in connector on the transmitter board. You will need to
set scan switch in one of the left positions. The display will not
show your actual frequency, but will show 144.xxx for 148.xxx,
145.xxx for 149.xxx, 146.xxx for 142.xxx and 147.xxx for 143.xxx
You will also need to install an offset crystal using the formula
xtal freq (Mhz) = 16.9 + offset (Mhz). There is more to do if you
want crossband capability.

If you are serious about doing this mod, you probably need a better
set of instructions than I have provided here. If you will send me
a SASE, I will photo copy the instruction sheet for you.

Depends on where your scanning. If your scanning in or near the HAM bands
the unit was designed to receive it'll do nicely. Also, a lot of these units
lack a sufficient number of memories to be used as a true scanner replacement.

> I am now undecided between the Yaesu and the ICOM but am
> leaning toward the ICOM because it *may* be able to serve as a
> poor man's monophonic walkman (88-108Mhz reception).
> Can an owner comment?

I've never seen an HT that will receive an FM signal in wide-band FM mode,
which is what you would need if you plan on listening to anything in this
range. My W2A will receive *strong* signals in this range, but is utterly
useless because it's receiving it as a narrow-band FM signal.

> There is another question I'd appreciate an informed answer to.
> There are a few extended RX channels I'd like to scan on occasion

Hardware mods or software mods, every HT I've ever seen will remember them.

> Would the ICOM forget them? I assume the extended RX must be reentered
> each time the unit is turned on, or is the unit smart enough to
> remember them, even though they're extended frequencies?

From my experience with Icom units, the "extended recieve mods" configures the CPU in a fairly permanant way (you *DON'T* have to perform the sequences every time you turn it on. Most HTs I've seen will remember whatever frequency you enter into the memory.

Quite frankly, if you're a serious scanner enthusiast you'll be sorely disappointed with using an HT as a scanner unless your content with scanning only a few frequencies at a time and aren't going to be scanning too far out of band (20-30 MHz). As always, your RX milage will vary from HT to HT.

Yes, they can scan. Yes, they are worth getting if you are looking for a solid, dependable single-band HT. No, they can not be modified for out-of-band reception.

Hope this helps,
Tom

It sounds like you got the one for Japanese domestic market. My
TS-430S was for JA market(I purchsed there) and I needed to cut one
jump wire (or something like that. It was long time ago) to make it
work like the one for U.S. market after getting my U.S. licence.

Hello!
I just recently got back into radio (am at college and now live where the antennas can be freely constructed-oh yes) and am toying with the idea of an old AM transmitter for late-night 160/75/40m QSOs which I enjoy listening to!

I have several questions about such gear that I'm hoping can be answered by more seasoned amateurs.
I am considering transmitters like the Johnson Ranger (I/II), Valiant (I/II), Heathkit DX-60B and DX-100 (B), BW 5100, and the like.

Here are my questions:
What is your recomendation?
Which rig has the best audio quality?
What are advantages/disadvantages to the above mentioned gear?
Which tubes are the hardest to find for such transmitters?
What are pitfalls to look for in my pursuit?
Where can I FIND this equipment!!!

I have been to several swaps and listened to many swap nets, but haven't found what I'm looking for yet...

If you can offer any advice or have such a rig for sale, please e-mail me at X90GALBRAIT1@WMICH.EDU

Any and all messages will be appreciated and the sender will be thrice blessed (once from me, and once from my roomate and girlfriend who are sick of hearing about these transmitters)...hi hi.

73s, Chris KA8WFC

1125. Cushcraft R-7 ?? Any Good??

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-11 06:38:38 UTC
From: Kenneth.Guthrie@launchpad.unc.edu
Message-ID: <2oar9e$7tb@samba.oit.unc.edu>
Source record: 227353

I recently bought a used Cushcraft R-7 vertical antenna and would like to get opinions on whether it is a good antenna or not. I would like to take my tri-band beam down and replace it the the R-7 if it is a good antenna. It still looks new. I would like to side mount it on my tower but the instruction pamphlet said not to mount near a tower, but was wondering if anyone had tried this?

Depending on the feedback I get, I will either use it or sell it.

Please E-mail if you have experience with this antenna.

Thanks,

Kenneth

It seems there are many of us in the market for a dual
band HT with extended RX so that one can be mobile with the
greatest amount of RX capability and the fewest number of
units. My summary of what's been offered is (no hands on
experience with any units) is . . .
<stuff deleted>

Don't do it Jerry.

I haven't seen a whole lot of HT's used in scanner service, but those
that I have seen have been sorely lacking. The extended receive ability
is just that... an extended receive. It is not a true "scanner" mode.
It is slow, it lacks banking and priority channer organization and it
makes the radio sensitive to overload and intermod, diminishing its value
as a communications tool.

Here's my two cents worth. Get a good scanner and a mobile transciever.
The scanner will get you the entertainment you desire and the transciever
will work the repeaters and simplex stations. If necessary, substitute
an HT for the mobile transciever. It will not do much for simplex but
will work those repeaters that are within a close distance.

If you choose the scanner/HT solution, consider the Radio Shack HTX-202.
It's a ham-band only radio with a very good front end and great audio
(for an HT). It's on sale until the end of the month for less than $190.
It's a great radio but don't take my word for it. Ask someone who owns one.

I abused my swell new icom w2a by using it as a mobile radio for a year.
I couldn't afford an HT and a mobile radio at the time. I now have both.
I can't imagine being without the mobile radio but life is possible
without the HT.

: Hello!
: I just recently got back into radio (am at college and now live where the
: antennas can be freely constructed-oh yes) and am toying with the idea of an
: old AM transmitter for late-night 160/75/40m QSOs which I enjoy listening to!

: I have several questions about such gear that I'm hoping can be answered by
: more seasoned amateurs.
: I am considering transmitters like the Johnson Ranger (I/II), Valiant (I/II),
: Heathkit DX-60B and DX-100 (B), BW 5100, and the like.
: Here are my questions:
: What is your recomendation?
: Which rig has the best audio quality?
: What are advantages/disadvantages to the above mentioned gear?
: Which tubes are the hardest to find for such transmitters?
: What are pitfalls to look for in my pursuit?
: Where can I FIND this equipment!!!

You will want a rig capable of at least 300 Watts AM and true plate
modulation. Rigs like the DX-60 are only about 30 Watts or so AM
and they use grid modulation of some sort. Some popular rigs for AM
include such vintage units as the Globe King 500 and the Johnson
Desktop Kilowatt.

The Radio Shack HTX-202 (and HTX-404 for 70 cm.) are ham band only radios that perform very well within the amateur radio band. They can scan within the band but cannot be modified to operate outside of the amateur radio band. They have been designed with a narrow front end intentionally to reduce the amount of interference from out of band signals that plagues other (wide band) radios. They have very good transmit and receive audio. The keypad is large and easy to use. I can operate it while wearing gloves!

I recently bought an HTX-404 to keep me company while my icom w2a was in the repair shop (didn't take my abuse very graciously) and now must sell it. I'll miss it, but may pick up an HTX-202 while it's on sale.

(Yes, I *DO* work part-time for Radio Shack but have nothing to gain from this testimonial.)

>me towards the source???

Sure! The back of the Alinco DJ580T manual!

The same mod desribed for Aircraft Band reception also gets you
860 to about 950 MHz on the UHF side. You MUST follow the unit's
reset proceedure after performing the mod.

The "mod" is to remove the battery contact plate at the bottom of the unit
and cut the red wire. (Or was it the blue wire? ;-)) Anyway, one of
the wires gives you Aircraft and 800/900 Mhz and the other one gives you
out-of-band transmit. Got 'em both and be safe! ;-))

Hi, I've been running an Alinco ALR72T 35watt UHF rig in an 87 Mazda 626 now for abt 8 months with no problems. Wired direct to batt with 14Ga, fed thru some grometted hole in the firewall. Radio on pass. side of center console. Antenna is now a Comet CA2X4MB (?) dual band, fed with Comet Low-loss coax, mounted at the top of the hatch. (Can't drill, I have a sunroof!) I used to run an MFJ mag mount, center roof. Transmitting with that used to light up my radar detector at some freqs. Still nothing affected the engine electronics though.

>range. It seems to hear 800 MHz OK. The exact same thing happens when
>he tunes below 440.000 MHz. The buzzing starts at 439.995

So now you have found that there is a filter switched in for use in
the ham bands. So far so good. It means that the W2A is not a completely
contemptable design for ham use.

>
>The problem sounds almost like local interference however, none of this
>buzzing sound is detected on my IC-24AT sitting 3 feet away - same antenna.

Now you have discovered that the interference is in a band that the
IC-24 is not sensitive to, or that the IC-24 has more dynamic range.
That's the trouble with extremely wideband receive.

>We took his W2A out to my car an put in on my mobile antenna and we could
>hear a few Phila police calls around 453 MHz in the noise on the mobile
>antenna while I was hearing them full quieting on my IC-24AT with the
>rubber duck.

So the car antenna also receives the interference well.

>
>Anyone else ever experience anything like this with a W2A?

Of course. Outside the ham bands, there's intermod all over the place
on both my W2A's. The lesson is that these things make lousy scanners.
If that's what you bought it for, take it back and get a good scanner.
You could also rig a low pass filter on the input of the W2A to make
respond more like the IC-24. You could easily try the radio at a location
some distance from where you have been experimenting to see if it is a
locally strong signal overloading the front end. You could further
experiment with attenuators and by using the scan mode and squelch
adjustment you can find the frequency of the offending transmitter.
A notch filter could then be built to eliminate the problem.

-dave

Source record: 227370

I have the American version of the Alinco 580 HT, but I may be going overseas and since their repeaters require a 1750 Hertz tone to be activated, I wonder if this feature can be added to my little rig.

Any idea anyone?

I have a friend who went to the UK last year and he said he managed to learn to whistle a 1750 tone that did the trick most of the time. The idea is to start with a low whistle tone and go up in frequency. I'm not much of a whistler myself and I'd rather have a miniboard or something that would give me the proper tone.

I believe the Johnson Viking and Valiant are plate modulated. You want to have plate modulation if you want the "really" good sounding signal. Most of the more inexpensive rigs like the Heath used screen grid modulation. While this works it doesn't have that broadcast quality sound.

Hi Jerry-

I've got the Yaesu FT-530 with extended receive, and am quite satisfied with it. T open it's range, you'll need to remove the solder (sp?) bridge on jumper 13 (tiny little sucker... you'll need strong light, patience, guts, great eyesight, and a steady hand -- or the money to pay someone else to do it). If you're going to do this, do it *BEFORE* loading up your memories. To activate extended receive after doing to mod, you'll have to reset the CPU -- thereby ERASING all memories. Once done, however, it works like a champ, and need not be done again.

You can program ANY frequency in memory, or leave it in a VFO. It *will* be retained after power-off. As others have said, it's a poor substitute for a real scanner. However, it'll do the job if you want to carry around only one unit. TX is opened too, but not much above 470 Mhz (just as well -- the high SWR would quickly fry it!) Also, as you might expect, the unit's sensitivity is diminished beyond amateur bands, getting worse the higher you go. Still, it's useful.

One thing I've noticed -- the quality is LOUSY in the 300-400 Mhz range. I pick up very little in that area (of course, there may be little or nothing TO receive), but what I do get is very muddy and barely comprehensible.

Hope that helps you make a decision. Yell if I can tell you more.

I posted about this in FidoNet, but I think I'd get a better response here. A couple of weeks ago I sent in my HTX-202 to get worked on. About a week and a half later it came back. But it came back with (I counted) 6 more problems! The main ones were a really noticable whine when recieving and when the thing gets hot, it goes off frequency! It never did either of those before! I thought maybe my experience was an isolated incident, but a friend from a local repeater sent his 202 to get repaired as well. His problem (a locked reciever) was fixed, but now it won't transmit PL tones! I'm a little wary about sending the rig back again to get the new problems fixed, who knows what condition it'll be in when I get it back this time?! Anyone else with some similar horror stories?

... Catch the Blue Wave!

The 1750Hz toneburst is still commonly used to access European repeaters.

Communications Specialists, Inc. markets a small encoder board specifically
for this purpose, just like the ones they sell for CTCSS applications. I have
one installed in a mobile rig, but it would fit nicely in most HT's. The cost
is about US$25-30, as I remember.

When I called them looking for mine, they knew just what I wanted. I can
find you the part number if you need it.

1150. Yaesu 890AT Power Output?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-11 21:37:08 UTC
From: piper@netcom.com
Message-ID: <piperCo46pw.4Is@netcom.com>
Source record: 227378

I recently purchased a Yaesu FT890AT. Out of the box the rig seems to put out only approximately 85 watts CW. In addition, on a peak meter, it only goes to 65 in a normal speaking voice, even with the mic gain turned up quite high. The folks at Yaesu say I can adjust power out internally and gave me the POT. Before I do this, has anyone else had this type of problem? Thanks for your help.

Reply either by posting or EMAIL.

Don't worry, if they remove CW from "all-mode" rigs you can still copy it on sideband ;). Why anyone would WANT to is another story.

All-band rigs also are not. (thank GOD!) I say we bag the 13 & 20 WPM requirement for advanced & extra class. Morse, while enjoyed by many and historically important, should not be "required" anymore than ascii hex or ax.25 proto-call. More advanced theory would be better than Morse, and might even "spark" some interest in the service from an electronics point of view. I think it would be cool to start a thread on this topic. Any takers ?

Green Card Lottery 1994 May Be The Last One!
THE DEADLINE HAS BEEN ANNOUNCED.

The Green Card Lottery is a completely legal program giving away a certain annual allotment of Green Cards to persons born in certain countries. The lottery program was scheduled to continue on a permanent basis. However, recently, Senator Alan J Simpson introduced a bill into the U. S. Congress which could end any future lotteries. THE 1994 LOTTERY IS SCHEDULED TO TAKE PLACE SOON, BUT IT MAY BE THE VERY LAST ONE.

PERSONS BORN IN MOST COUNTRIES QUALIFY, MANY FOR FIRST TIME.

The only countries NOT qualifying are: Mexico; India; P.R. China; Taiwan, Philippines, North Korea, Canada, United Kingdom (except Northern Ireland), Jamaica, Domican Republic, El Salvador and Vietnam.

Lottery registration will take place soon. 55,000 Green Cards will be given to those who register correctly. NO JOB IS REQUIRED.

THERE IS A STRICT JUNE DEADLINE. THE TIME TO START IS NOW!!

For FREE information via Email, send request to cslaw@indirect.com

Ne> 439.995
Ne> Pete Rossi - WA3NNA rossi@vfl.paramax.COM

Hi, Pete. I've had a W2A for several years. I know about the buzz, but
have only a clue on the sensitivity prolem.

About the buzz: here in the Raleigh, NC area, we have UHF TV stations on
channel 22 and 28, exactly 36 MHz apart. The UHF IF on the radio is
35.8 MHz, 200 kHz lower than the mix product of the two TV stations.

Tune 200 kHz off a TV station carrier and you hear... buzz. And since
it's in the IF, you hear it EVERYWHERE... except in the ham band.

Why? Read on... (and check to see if you have 2 UHF TV stations
6 channels apart).

The W2A has two sets of front-end filters for UHF. A "narrow" filter
is switched in when the radio is tuned between 440 and 450 Mhz. The
"wide" filter is employed when tuning outside that range. The "narrow"
filter acually hears from about 430 to 470 MHz with fair sensitivity.
With the "narrow" filter in line, the signals from the UHF TV stations
(500 MHz and up) are filtered out, so the buzz is gone when tuning the ham
band.

Icom (and probably a dealer who knows about it) can modifiy the radio
to leave the filter "narrow" at all times. You "lose" all sensitivity in
the 500 and 600 MHz bands, but the UHF public service band is still
good. 800 MHz and VHF are not affected. I've had two W2A's so modified
and I like it. Icom told me the public service band sensitivity is
actually improved a little with the mod.

Now that I think of it, perhaps the "wide" filter is defective. Before
I had the mod, I heard signals there OK.

Good luck and 73,

Gary KN4AQ, Raleigh, NC

>Randy KE3HB

What a brave soul you are! Well, let me get this thing started by NOT flaming you, even though I enjoy CW very much (LOTS of CW DX on 30 meters). However, part of the reason we still have a code requirement is that so do most other countries, and for reciprocal licensing to continue to work we'd need to keep the requirement. Archaic, maybe, but there it is.

Having said that, let me point out also that the why-do-we-need-cw-anyway controversy has been around a LONG time. It was roaring loud and strong in the early-mid '70s, when a no-code license was first suggested. Even though I like CW and enjoy it, I have to agree with an observation by Ted Mathewson, W4FJ, who was licensed in the 1930s when it was REALLY HARD to pass the test (no license manuals, no courses taught by local clubs, and the examiner at the FCC office could use any questions he felt like, and ask for complicated schematics drawn from memory, etc. But I digress.). Ted said that the problem a lot of the "old-timers" have is that they confuse CW with technical knowledge, sort of implying that CW requires some particular intellectual ability. It doesn't. It is an ACQUIRED SKILL, like typing. In fact, too much "thinking" SLOWS YOU DOWN when trying to copy, especially at high speed.

Ted told this story: immediately following WWII, the USAAF enlisted the help of local natives in North Africa to track position reports of squdrons of bombers returning to the US for decommissioning. These operators were ILLITERATE, but were given typewriters and taught to associate a sound (letter or number in code) with a symbol on the typewriter key. The result was that these operators, after several weeks of practice, were happily copying incoming position reports in CW at 14 WPM and had ABSOLUTELY NO IDEA what the messages said.

The only NEED for a code test is, IMHO, for those who wish to operate in the CW-only allotted portions of the HF bands, which are pretty much established by international agreement. So, we could

have "code-free" General and Advanced with the existing 'phone band allottments, and a "Plus" for doing the 13 WPM thing which then gives current access. Just a thought.....

than ascii hex or ax.25 proto-call. More advanced theory would be
better than Morse, and might even "spark" some interest in the
service from an electronics point of view.
Randy KE3HB

I thought that that was the purpose for the Codeless tech license?
I my self have passed the test, just waiting for call sign.

I do think that there should be more electronic pursuit among
the hams rather than simply spending a larger amount of $$$ to buy
a bigger & better rig, buy a prefab tnc, buy a prefab computer,
buy a prefab antenna tuner, buy a prefab antenna....

Who is the better ham, the guy with all new shiney top of the line
stuff, or the guy who uses a modified icom ic2at, homemade 5/8 antenna
made from speaker wire, fishing rod, hair curler & scrap ethernet cable?

Your turn.

I'm glad you enjoyed my comments. I hope they were useful to others faced
with trying to decide how to decide on a radio.

As you guessed, shopping for the rig and actually using are BOTH fun.
Right now, since I'm still waiting for the FCC to mail me the license
(9 weeks and counting after taking the exams) so I'm still just
listening. But that's fun. I'm intent upon developing my CW ability
so I'm copying any signals I can, just plugging along. It'll only
get better once I can try actually participating.

Thanks for your comments!

Thanks for the response. I have contacted some people about ordering new
crystals and the things are not cheap. It would cost me $70 to $80 dollars
to put two channels (separate send and recieve xtals) into this radio which
changes it from an inexpensive surplus comm. solution to an expensive 'I
should have bought a synthesized rig' solution.

There must be zillions of surplus crystals out there at less than $16 to
$20 each. Any idea where they all went?

Thanks again,

Joe

The Heath DX100 and B are plate modulated and good for some 180W DC input, the DX60 is screen modulated and not renouned for its AM. The DX100 is one of the favourite AM boatanchors - right in there with Collins and Johnson.

An earlier poster claimed that a minimum of 300W is required for AM (? DC input ? output ? carrier ?), I don't think so, not many AM rigs run that kind of power. Developing significant AM power requires a lot of copper and electricity, compact power applies to CW and SSB but not AM.

We've never had such a thread before, and many people might find it
interesting. However, code requirements sound like a policy issue,
so I'd highly recommend you start this thread in rec.radio.amateur.policy.
I'm sure at least a few people will give it some thought.

There's no reason why screen modulation can't be just as clean as
plate modulation. I'd expect that your observation re `inexpensive
rigs' is the real determinant here. That is, they didn't sound good
because they were low-end rigs, rather than because they were
screen-modulated. On the other hand, plate modulation does get a lot
more AM signal out of the same RF section and so you'd expect to find
it in mid and high-end rigs.

Mike,
I purchased and FT-890AT last May and have had no problems with it other
than the
antenna tuner goes into lala land occasionally. If you press the TUNE
button and then
decide that you want to stop, DON'T press the GEN/HAM button. It doesn't
happen
all the time, maybe once in 10 times. It locks into tune mode and stays
there until
you turn the rig off. Yaesu doesn't know about this so it might just be my
rig. I never
took it back to fix it because it really isn't a problem. The rig isn't
putting out any RF
so the tuner never gets tuned.

Other than that the 890 is a fantastic rig. I get from 100 to 150 watts out
on CW and SSB.
It sure was an upgrade from my FT-101E!

randyrho@drycas.club.cc.cmu.edu wrote:
: Don't worry, if they remove CW from "all-mode" rigs you can still
: copy it on sideband ;). Why anyone would WANT to is another story.

: All-band rigs also are not. (thank GOD!) I say we bag the 13 & 20
: WPM requirement for advanced & extra class. Morse, while enjoyed
: by many and historically important, should not be "required" anymore
: than ascii hex or ax.25 proto-call. More advanced theory would be
: better than Morse, and might even "spark" some interest in the
: service from an electronics point of view. I think it would be
: cool to start a thread on this topic. Any takers ?

: Randy KE3HB

I like cw (morse to the non-cw types) but that is another issue.

What caught my eye in Randy's post is the part about "more advanced
theory".

I have an extra class license which means that I was able to get
enough correct answers on the extra test. But it does not necessarily
mean that I understand the theory or the application of electronics.

It would be nice if there was some sort of endorsement system that
would encourage amateurs to study theory. There are so many
technical areas for Hams now that one person cannot know everything.

It would be nice if there were endorsements for passing tests in areas
such as AX.25, spread spectrum, ATV, SSTV, Lasers, DSP's, etc.
etc. There might not be any additional priviledges, but it might
encourage us to try and keep up the technology.

I am looking for a copy of the manual for a UHF mobile radio made by
Western Radio. Model WR454. It is a two channel cristal mobile.
I would like to bring it in the ham band.

I will pay for the copy or for the original.

Regards,
Clem.

Richard Loken (tech@aupair.cs.athabascau.ca) wrote:
: An earlier poster claimed that a minimum of 300W is required for AM (? DC
: input ? output ? carrier ?), I don't think so, not many AM rigs run that
: kind of power. Developing significant AM power requires a lot of copper and
: electricity, compact power applies to CW and SSB but not AM.

If you want to participate on an equal footing with fellow AM enthusiasts you are going to have a strong signal and good fidelity. Here in the east, most AM activity is on 160 and 75 meters. Noise levels are high and a strong signal is a must, particularly since AM is less efficient than SSB. U.S. ops should have at least an advanced ticket to be able to operate in the portions of the band where AM activity takes place. The primary enjoyment of AM activity is in the signal quality. Some of the amateur stations have better fidelity than many AM broadcast stations. If you have a marginal signal you will develop a "bad reputation" among fellow AMers. ;-)

Listen any night between about 3820 and 3890 KHz for some really fine AM stations. Marvel at the quality of the audio in contrast to most SSB "slop bucket" transmitters.

I am a public service and amateur operator. I have an HT in my car usually and want to get a small amp to boost its power. I found an amp that it supposedly for public service band that puts out 30w. I want to know if an amp could be tuned in the middle, between say 144 and 160, so that I can transmit on my ham and fire/rescue freqs. I realize that this will compromise some efficiency, but can it work without damaging the radio? My radio is not modified, but is a Icom H-16 which has a wideband trans. ability. Thank you for any help or insight you may be able to offer.

Please e-mail direct.

What the gentleman described is what is known as semi-break-in. It is not the same as full break-in, though it's still useful.

I'm hesitant to turn down the delay on the TS-830S I use because I fear for the relay lifetime as they chatter after every dit. Besides, they are so noisy, they'd cover up anyone else who was sending while I was! :-) It's sufficient to hear between words; I will wait for another transceiver before I try to hear people between letters or between dits and dahs.

1178. Yaesu 840 impressions

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-12 21:26:22 UTC
From: mtrail@violet.berkeley.edu
Message-ID: <2of3lu$ajd@agate.berkeley.edu>
Source record: 227313

The new Yaesu 840 hf rig is on sale for about $735 at the
moment, making it the most attractive rig for its price and features.
Has anyone had any operating experience with it? I've listened to it
over at the local HRO, but band conditions this weekend were so
bad it was hard to get a feel for how well it performed.
It DOES seem to be a solid rig, mechanically--far more so than
the Icom rigs I've seen, and equivalent to the Kenwoods.
Thanks for your impressions.
Matt Trail KN6CR

Source record: 227303

Hi

This is my first attempt to do anything with radio so im a bit unsure how a few things work.

I want to build a reciever to work in the high VHF range ~160Mhz, for transmitting digital data, I am considering using IC's because space is a premium. I am looking at using a Motorola MC3362 narrowband FM reciever. In the many books I have been reading they suggest using a phased lock loop and/or? duel modulas prescalers for circuits to work at high frequencies. The problem is that I don't understand what the PLL and prescler are supposed to do and I don't understand how they work. The PLL seems to allow multiple channels but that is not a requirement, does it offer superior frequency stability?

The MC3362 also has two inputs to the first mixer, some example circuits use both inputs using a transformer for impedence matching, other examples use only one input (other input grouded) and inductors for impedence matching, whats the advantage of using the two inputs Vs one input to the first mixer?

Thanks in advance for any help
Andy.

1185. Request for comments on Standard Mobile 5718DA

I have a Standard C5718DA (had it about 2 months) mounted remote in my fullsize bronco. I think it's a fine radio, as compared to my Kenwood TM732A, with a few exceptions. The normally analog volume and squelch knobs have been replaced by a multi-function "VO/SQ" button that toggles between the modes. You adjust these controls with the channel/freq. up/down buttons. No problem, except when you are simplex and the guys signal drops below the squelch and you have to spend 20 seconds adjusting it. Also, the buttons on the mike are quite small, most serve several purposes, and their level of effort is much higher than most most ham gear. On the positive side, the rx/tx audio is good, and the intermod rejection (especially on 440) is much better than my Kenwood. Is it worth the $700? Only if you need the remotability without a separate mic/control head, or if you are an incurable gadget freak like me.

Well, no horror stories here, just a suggestion if it's not too late.
Buy the Radio Shack service plan! For $49.95 you get five years total
coverage, with no deductible. All you pay is shipping, and there's a
section in the fine print (in YOUR favor) that says if it's uneconomical
to fix, they'll give you a new one. For 50 bux, mine's covered till
January 1999.

Many rigs, as you say, have the facility built-in already to generate
the Euro-tone. Most designs make it an either/or arrangement -- you can you
either CTCSS or the 1750Hz burst, but not both.

To find out how to do it in your rig, ask Alinco USA for a service manual.
When I have asked, they've sent them at no charge. Then take a look at the
circuit schematic and figure out what you need to do.

If you happen to have an Alinco DJ-120T hand-held, all you need to do is set
the CTCSS dip-switch to a particular non-standard position, and out comes a
1750Hz tone! If anybody cares, ask and I'll research which position it is;
that info is filed away somewhere...

The *best* kind of tests for amateurs are of the practical kind.
IE diagnose and repair a piece of commercial equipment, build a
piece of equipment from scratch that *works* properly, etc. The
satisfaction from accomplishing these tasks should be sufficient
reward without need for paper certificates.

>Please help!

You don't mention the purpose, schedule, or reliability requirements
of the link. If you need a 7x24 reliable voice grade or higher circuit,
then your only radio alternative is a link through a GEO satellite.
If you only need a link intermitantly, but on a predictable schedule,
then the eccentric orbit satellites will suffice. If you can accept
highly irregular and widely varying link quality with little or no
schedule reliablity, then HF (shortwave) is an alternative. If you
need a highly reliable circuit with very low information bandwidth,
then a high power VLF or ELF link is possible.

Costs will range from a few thousand dollars to hundreds of thousands
depending on which alternative is suitable. If all you want is a once
in a blue moon (totally random luck of the ionosphere) exchange of calls
and signal reports, a low cost HF CW setup could work for from fifty to
a few hundred dollars.

If your intent is to bypass international telephone charges, forget
it. You won't break even on the investment in a reasonable amount
of time unless you're a very high volume, or high bandwidth, user.
Even then you can demand the high volume bypass discount rate from
the telcos or their alternate suppliers. Unless the telcos simply
refuse to give you volume bypass rates, it isn't economic to set up
your own links.

Tennessee Technological University
QRP Expedition
TTARS-WA4UCE

The QRP expedition is this weekend April 16, 17. So far looks like the Yaesu 301S and the MFJ 20 meter SSB travel radio are definites, as well as testing out a MFJ Super HI Q loop and a ZS6??? multiband dipole (variation of a G5RV that seems to perform better).

The two main purposes of the expedition are to foster interest in HF with the college hams here in Cookeville, and to demonstrate the effectiveness of low power operation with SSB, even with portable battery operated setups.

We will be operating from Fall Creek Falls state Park in the south central part of Tennessee. We will be setting up one base station from a campground and another portable operation that will go to some remote sections of the park.

For a nice certificate send a 9X12 SASE with QSL card and contact number to:

TTARS-WA4UCE
Tennessee Tech. U.
Box 5262
Cookeville, TN 38505

*probably start afternoon of Friday April 15.

WA4UCE Club Station
Sat. April 16 and Sunday April 17

14:00-16:00Z (7.250-2.270)
(7.055-7.065)

16:00-17:00Z (14.250-14.265)
(14.055-14.065)* if enough ops

17:00-18:00Z (28.350-28.365)

18:00-20:00Z (21.250-21.265)
(21.050-21.065)*

20:00-22:00Z (14.250-14.265)
(10.110-10.115)*

22:00-24:00Z (7.250-7.270)

00:00-02:00Z (3.900-3.915) or
(7.250-7.270)

==========

* we will operate on whichever band has best propogation. We will attempt to stay with the above frequencies as much as possible. The way conditions have been lately, 20 meters will most likely be our main backup band.

thanks

Don't know! Better is one of those nice relative terms.. Seems to me that the hobby is big enough for all of us. Appliance operators, no code techs, QRPers, Foxhunters, Boatanchor buffs, Contestors, Paper chasers, Packet racket, Ham TV, Traffic Handlers, ragchewers, Repeater operators, homebrewers, VEC's, Satellite stations, antenna gurus, and just plain hams all contribute to the hobby. The "best" ham that I know is the 9-year-old that sat down and aced the Novice test that I helped administer, a couple of years ago. I hope that he learns to enjoy the fun of tinkering with the gear, as I do. But, as long as he maintains the enthusiasm that helped him pass that test, I think he is a darn good ham.

How did we get this on rec.radio.equipment? Guess I should take my soapbox over to .misc or .policy...

Enough for my turn!

Tks
Oh, I see(disappointed..). I wonder why Yaesu doesn't want to make TS-50 equivalent. Maybe we should make a big noise. Thinking that my TS-430 use no SMT and probably FT-747 is the same, just introducing SMT alone would be enough to come up with something like TS-50, I would think.... But, then, FT-11 could be actually Yaesu's answer to TS-50(Hey! Kenwood! You can't beat us on VHF :P Nahhhhh...)

A couple of weeks ago I sent in my HTX-202 to get worked on.
About a week and a half later it came back. But it came back with (I counted) 6 more problems! The main ones were a really noticable whine when recieving and when the thing gets hot, it goes off frequency! It never did either of those before! I thought maybe my experience was an isolated incident, but a friend from a local repeater sent his 202 to get repaired as well. His problem (a locked reciever) was fixed, but now it won't transmit PL tones! I'm a little wary about sending the rig back again to get the new problems fixed, who knows what condition it'll be in when I get it back this time?! Anyone else with some similar horror stories?

I haven't heard of any wide spread problems with the HTX-202. It seems to have fewer problems than other HT's here on the net.

It sounds like your local service center may have a technician that isn't on the ball. This is regretable, but every profession has its stars and its dimwits.

My advice is to keep taking it back until they get it right. If necessary, they can replace the radio, but not until it has been serviced some number to times (the number escapes me, but it isn't a small number). Fill out the problem report yourself. Don't trust the RS sales person to correctly interpret your description of the problem. When you pick up the radio, test it right in the store if possible and refuse to take it if it isn't repaired.

Yes, its true -- Radio Shack has a DSP audio filter for $79 with built in speaker. Does anyone have any experience with one? I saw one at the store yesterday but did not buy it yet fearing that it was not as good as the Timewave DSP-9 (which is $159). Does anyone know what DSP chip is used and how many bit A-D/D-A conversion is used? The DSP-9 uses the Analog Devices 21xx DSP chip and the 16bit AD1848 a-d/d-a combo and claims very low time delay (compared to other filters).

Does any one know what the time delay in the RS filter is?

How many carriers can it notch at once in SSB mode?

Gee Tom, you never buy anything at the shack? You can always take it back within 30 days with no grief?

Anyways, with that in mind, I bought one last Friday on the way home. It is wonderful. Really does the job on my MFJ and Ten Tec Argonaut QRP rigs. Keep in mind that these radios have NOTHING in the way of filtering.

On my Corsair, the improvements were more modest. The Corsair uses a PTO and crystal mixed osc. so it's nowhere near as "noisey" on receive as the japanese PLL rigs such as my TS-440S. The DSP still reduced thermal noises from the audio and IF amps.

The notch filter DOES NOT work in CW, obviously, as neither does the TWT-9. N8CVC has both filters and although the Time wave is MUCH sharper on CW (100Hz -vs- 300) for $100 less, the RS unit is the way to go.

I'm not taking mine back.

>Who is the better ham, the guy with all new shiney top of the line
>stuff, or the guy who uses a modified icom ic2at, homemade 5/8 antenna
>made from speaker wire, fishing rod, hair curler & scrap ethernet cable?

The better ham is the one who more effectively communicates with whatever equipment he has. That's what radio is about, communication. Now whether one approaches that goal as a systems engineer with an open checkbook, or as an el cheapo hacker with improvised equipment is more a matter of taste and economics than whether one is a better ham or not.

In either case, it takes understanding of system dynamics to create an effective communications system. As long as that understanding is present, it doesn't matter at what level of abstraction the station is assembled. Raw galena, glass, tubes, transistors, ICs, board level systems, and box level systems are all building blocks for communications systems. Each is at a higher level of abstraction than the one before, but each can be viewed as a component of a communications system.

We don't require hams to polish galena or blow glass anymore, but on the other hand hams who had to do that weren't expected to understand AX25 or RS232. A ham may be more flexible if his mental tool set includes detailed knowledge that traverses all levels of abstraction, but for any given communications task it's unlikely that detail knowledge of all levels is required, or even desired because of the forest and trees effect. It's all too easy to get lost in minor details while missing the larger picture. That larger picture is to effectively transfer information from location to location via EM radiation.

I had great SATISFACTION after building one of my first major homebrew pro-
jects of a approx. 14 tube RTTY tuner from an article in CQ magazine back in
the early 60's. I added a 2" CRT circuit from description in ARRL Handbook.
I pluuged it in for the smoke test...It was successful...it SMOKED! I found the
cause as a short in the filasment circuit. That fixed I tried again and the
darn thing WORKED!!!! WOW was I ever proud of myself! Further I traced the
different signal types with different colored pencils on the schematic to be
able to further try to understand how it worked.
It was a very good learning experience!!!! I only wish I could remember half of
what I learned. I guess maybe age or lack of pravtice has caught up with me.

1205. HTs with extended RX (interim report)

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-13 18:39:07 UTC
From: jerry@hnrc.tufts.edu
Message-ID: <1994Apr13.133907.2210@hnrc.tufts.edu>
Source record: 227328

An interim summary . . .

Tha Alinco has its adherents, but its owners are free to
admit that intermod can be a problem. No one has suggested
passing up other units in favor of Alinco.

The ICOM comments surprised me. Many gave it a nod, but
no one was passionate about it. The compliments seemed almost
perfunctory.

Yaesu owners for the most part have strong feeling about
their units. The strongest Yaesu and Standard advocates were
equally adamant.

Where I am: HT's do not receive wideband FM. Therefore,
ICOM W21-AT's ability to receive 88-108Mhz only gives the
illusion that it might serve as a substitute Walkman. Since
the YAESU has most of the ICOMs other features at lower cost,
this eliminates the ICOM from the list.

The FT-530 and the 558A are quite comparable (I've been
told I was mistaken in my earlier post: the 558A has CTCSS
encode/decode and searching), but each has features the other
lacks:

FT-530: dual in-band receive, lighted keypad, hardware
mod for extended RX

558A: better intermod rejection, sturdier, $130 more,
software mod

I am leaning quite heavily toward the Yaesu because of the
dual in-band receive, but if I were sure this feature were not
necessary I'd go for the Standard for the intermod rejection
and durability. (I am also assuming that out of band RX while
somewhat insensitive, will be similar for the two units.)

Remember one thing..(I own both [530 and W21-AT]) The 530 has vastly superior
rejection of computer induced noise...superior front end rejection
of nearby transmitters..and rejection of intermod garbage..and is in
my opinion..more sencitive...and MUCH more sencitive out of band..
and is easier to program..and has better audio...and is smaller..
and feels better in your hand...and looks better...and is more rugged..
and has a better display...and a better power switch...and more features
and has PL tone search...and is still moddable...and is cheaper...
and has a better scuff resistance to the paint job and stenciling..
and is almost a generation ahead in overall design than the Icom..

The Standard C558A comes with CTCSS encode AND decode, it is NOT an
option. Someone has given you some erroneous information.
I have a C558A and would not hesitate to recommend it to anyone. I bought
mine because the Standards were the only rigs not overwhelmed by intermod at
the Dayton hamfest. After buying it, I was pleased to find that they also get
the best battery-life and are terribly well made.
From my experience, which is considerable, since I occasionally work for
an amateur mail order outfit, the Standards have better out of band performance
than most of the rigs I've seen. Sensitivity is very good from 115-170mHz on
vhf and 420-470mHz on uhf. The RX performance on 800-900mHz is also very good,
much better than either the Icom W21AT or the FT530. I've owned an FT530 and I
was very unhappy with it, way too much intermod. The W21AT is better, but not
much. The 50-900mHz range given for the W21 is a bit misleading, mostly because
there are areas in that range where the receiver is almost completely dead, to
the point of being useless.
The C558A is the best amateur dual-band HT, without question. It does lack
a lighted keyboard and dual in-band RX. If you must have those features, go
with the W21AT. If you can do without those, then the Standard will reward you
by going longer between charges, having a better receiver and being more
rugged.

[Later]

Dual in-band RX is nice, but I didn't really use it much when I had the
FT530. It seems to worsen the intermod problem, since to make it work the band-
pass filtering has to disabled. None of the rigs with that feature seem to have
decent intermod rejection, except the Standard C5718 mobile, which has 5 front-
ends. If you want that feature, wait a year or so. Standard is in the process
of designing another dual band HT that will include dual in-band RX. I'd buy
the C558A now, and if the new rig appealed to you, you could trade it in. That
is what I plan to do.
When you go to HRO, be sure to ask the guy which HT has the best receiver
performance, and which one is the most well made. If he knows what he's talking
about, he will say the Standard. I was turned on to the Standards by the tech
at the Ham Station, who couldn't believe how well designed they were. I put-off
buying one, but once I went to Dayton in 1992, I was sold. As you might guess,
Dayton is really a benchmark for HTs. Not only for RX performance, but battery
life, as well.

[My note: At HRO I was told the Standard is the best and that if I
didn't get one now I would probably want to move up later.]

I own the Yaesu FT530 and use it not only for hamming, but extensively for
public service band monitoring.

What I love about the FT530:

a) You can monitor both the repeater and repeater input. Thus, if mobile
units ask to have the repeater off you are right in there with the ability to
receive them on the input - if they are close by. There are two ways to

accomplish this - one is to program the repeater offset into the radio - then a quick flick of the thumb to a button just about the PTT button will automatically unsquelch the unit and change the freq to the repeater input. The second method is to listen to the two simultaneously by transferring the input freq to the second receiver - Before the FT530 I had to scan between these channels to do this.

b) The "intelligent" battery save option really cuts down on battery consumption for infrequently used channels - it senses how often the channel is being used and the longer it goes unused the less current the radio draws as it goes more and more into a "sleep" mode - I tested this with a VOM and every 10 seconds of non-use lowered the current draw until it got down to about 15 mA.

c) It allows CTCSS search and alarm functions. For example if your local PD and several other nearby towns share the same freq, but use different CTCSS tones, you can program these in to only select out what you want to hear. ADDITIONALLY, you can set an alarm to go off when the transmission with that CTCSS tone goes off.

My big vote - go for the Yaesu!

[Later]
I would have to agree that the 530 does have intermod problems in the big city, but I haven't met a mini HT that doesn't - can you get a Standard on trial to try it?

The dual in-band RX has implications for use as a scanner too!

Dual in-band RX is nice, but I didn't really use it much when I had the FT530. It seems to worsen the intermod problem, since to make it work the band-pass filtering has to disabled. None of the rigs with that feature seem to have decent intermod rejection, except the Standard C5718 mobile, which has 5 front-ends. If you want that feature, wait a year or so. Standard is in the process of designing another dual band HT that will include dual in-band RX. I'd buy the C558A now, and if the new rig appealed to you, you could trade it in. That is what I plan to do.

I'd like to get started in QRP (cw and maybe ssb) and like to get
recommendations as to what kind of equipment I need, where I can
get them, antennas, and other general information about QRP.

please email replies if possible.
thanks in advance

1207. RePost: Tesla E34L tubes for sale

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-13 19:36:58 UTC
From: RICHARD_BOLT@CCMAIL.GSFC.NASA.GOV
Message-ID: <RICHARD_BOLT-130494143741@bolt.gsfc.nasa.gov>
Source record: 227330

For sale : TESLA (Czech) E34L tubes

E34L is TESLA's better model of EL34/6CA7.
They sound great. Though not as sweet and smooth sounding as Sylvania
NOS EL34's, but they are close. TESLA sound better than Sovtek and GE.

Czech/TESLA close thier factory and stop making E34L while ago. You will
notice that it's harder and harder to find TESLA E34L's. Just like
Sylvania EL34's.

Please note that I am selling the TESLA E34L's not the TESLA EL34's.
They usually have a $5.00 price difference per tube. Of course, E34L
is HIGHER then EL34.

I am asking $60.00 + 1/2 of shipping per 4 tubes.
If interested, please E-main or call me.
Thanks.

I am looking for a used spectrum analyser, HP or TEK. Must cover 30 MHz to
20 GHz and have a built-in tracking generator. This unit is to be used in a
university physics laboratory and is to be purchased by the end of THIS month
(april).
Would anyone with equipment to sell contact me via email ASAP.
Thanks

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I have a problem with my Ramsey FX-223 220 Mhz amateur radio.
The receiver has a pronounced squeal when unsquelched and the
demodulated audio is extremely distorted. I suspected an IF
problem, and the Tech Support staff suggested I send these parts
in for testing:

Part# Quantity Description

Y1 1 21.855 MHz 2nd Oscillator Crystal
FL1 1 21.4 MHz 1st IF Filter
FL2,FL3 2 455kHZ 2nd IF Crystal Filters

I sent these parts in to Ramsey and they sent them back and told
me that there was no problem with them. I would appreciate some help
from anyone who has experienced a similar problem or has a suggestion.
Feel free to E-mail direct or post back to this thread.

Carson (N7VDY)

>I don't understand how they work. The PLL seems to allow multiple channels but
>that is not a requirement, does it offer superior frequency stability?

If you're only interested in one frequency, just use a single crystal.
The PLL is for frequency agility. Don't bother with LC tanks, too unstable
at VHF.

>The MC3362 also has two inputs to the first mixer, some example circuits use
>both inputs using a transformer for impedence matching, other examples
>use only one input (other input grouded) and inductors for impedence matching,
>whats the advantage of using the two inputs Vs one input to the first mixer?

It depends entirely on the circuit in front of the chip. If its a balanced
circuit, as in some filter networks, then feed it balanced. If, as is more
likely, its an unbalanced network, then connect it unbalanced.

Source record: 227343

In article <toma.10.000BB427@xetron.com> toma@xetron.com (Tom Alverson) writes:

Yes, its true -- Radio Shack has a DSP audio filter for $79 with built in speaker. Does anyone have any experience with one? I saw one at the store yesterday but did not buy it yet fearing that it was not as good as the Timewave DSP-9 (which is $159). Does anyone know what DSP chip is used and how many bit A-D/D-A conversion is used? The DSP-9 uses the Analog Devices 21xx DSP chip and the 16bit AD1848 a-d/d-a combo and claims very low time delay (compared to other filters).

Does any one know what the time delay in the RS filter is?

How many carriers can it notch at once in SSB mode?

I wrote the following product mini-report for our club newsletter based on two evenings' use.
---------- begin report ----------

Product Report - REALISTIC DSP

I recently got a Realistic DSP Communication Noise Reduction System (DSP) from Radio Shack for a friend, but held on to it for a few days to see how it works.

The DSP is a smallish black box that measures about 2 x 4 1/2 x 7 inches. It's roughly the size of a large paperback book, but a bit longer. It comes supplied with a 12 volt power lead, signal input lead with 1/8" mini jacks and mounting hardware for a mobile installation. It has four controls and a headphone jack across the front panel. The back of the unit has connections for power, signal in and external speaker.

The front panel controls are for bandwidth (narrow, medium and wide), filter (NR (noise reduction), SSB and CW), volume/off and DSP (active or bypassed).

I used an icom IC735 transciever with a 40 meter dipole for a signal source. The DSP connected to the radios external speaker jack via the supplied cable. I tested the unit with my station speaker and with the internal speaker. Power was obtained from the storage battery that powers the rest of the staion. Tests were run on April 11 and April 13 on several HF bands including the Citizens Band. Tests were conducted with all combinations of radio filters and DSP filters.

I had a great deal of trouble finding satisfactory test conditions. The ionosphere was just not cooperating! I really wanted to find some of those signals that were almost impossible to copy due to QRM or QRN, but could only find a couple. I even spun the dial up to CB channel 19 looking for

jammers. It was slim pickings there too.

In the SSB mode The Realistic DSP unit does a very good job of cutting out the squeals of hetrodynes and reduction of atmospheric noise. The internal computer recognized the squals as undesired noise and simply did not pass them. There was no evidence of `ringing' on the narrowest filter setting in the CW mode. The filter `skirts' appear to be quite steep, completely knocking out an ajacent CW station just a few hundred Hertz away from the desired signal. Indeed, it's somewhat unnerving to watch the radio's S meter swing back and forth in response to a strong but undesired signal without hearing any of that signal in the speaker. The audio was clear and quite loud due in part to the 6 watt audio amplifier (Did you ever wonder why the $29 CB radios have more powerful audio sections than 2meter rigs costing ten times as much?) Oddly enough, when the signals were clean enough to not need the DSP, it was better to switch it out of the circuit. The DSP seemed to impart a small buzz in an otherwise clean signal.

Some specs: With the unit turned on but DSP disabled the frequency response is 300-3000 Hz. In CW mode you can choose 269-1231 Hz (962 Hz bw), 469-1031 Hz (562 Hz bw) or 597-903 Hz (306 Hz bw). In SSB mode the choices are 300-3000, 500-2600 and 800-2000 Hz. There is another mode called Noise Reduction whose requency response numbers are 200-2950 (2750 Hz), 200-2500 (2300 Hz) and 200-2000 Hz (1800 Hz).

It claims to have a 40 dB heterodyne rejection in SSB/NR mode and a 20 dB noise reduction in NR mode.

A special order has been placed to assure that the <location deleted> Radio Shack store has ample quantities of this unit. N8CVC claims that this unit works as well as another popular unit that costs twice as much. At $79 plus change, it appears to be quite a deal.
------------------------------ end report ------------------------------

Before anyone challenges me.... Yes, I *DO* work part-time for Radio Shack at the <location deleted> store. I don't believe I have anyhting to gain from this product report, but if the net.flamers see it differently... well... that's too bad.

Hi

I am looking to by a new mobile FM radio for 2M and 440. I am looking at the Kenwoods TM 741 (742), TM 732 (733). I would like to know what you think of these two radios?

- Are their any known problems with either of them?

- How reliable are they?

- How easy is it to put a third band in the 741?

- How easy is it to remote the control heads on these radios?

Also if you think anohter brand might be better please let me know.

Thanks very much for your help

Dave Post

>Alinco does not want to tell us which one it is. They want $50 to do
>it, which is a bit of a ripp-off, in my opinion.

I looked at the schematic for a friends's Alinco Dual-Bander because I
needed a dual-bander and 1750 toneburst for my UK trips.

It turned out that this Alinco replaced the DTMF board with the 1750 tone
burst board on European models.

I wrote an article back in 1991 that made it's way into info-hams (and also
the QRZ disk) that tells how to add tone burst to a ICOM 24AT (It's two
surface mount resistors added for the audio path and removing a diode for
configuration). I ended up with a W2A which looks like it is 5 components
and diode configuration change, but I have not tried it yet.

I would suggest that if there is tone circuitry on the board, then there
very well might be a configuration jumper to cut.

As you look for a "first rig," don't forget hamfests...there are lots of good "older" rigs out there...and at the hamfests you can talk with hams who have actually used the rig and know how it performs. After saving my pennies, I bought a Yaesu Ft101-E (circa late 1970's??) about 6 weeks ago, and it is working great. Came in under budget, even considering the purchase of antenna wire, cable, books, etc. So, as many of the other writers have commented, don't get "wowed" by the glitzy ads in the magazines and don't think you have to have all the bells and whistles on your first rig. I am a "re-tread" ham - was licensed in the 1960's BST (before solid state) - and have re-activated since 1987. Lots of differences...lots of improvements...but I think there is a dependency on high-tech stuff that might get in the way of the simplicity of making contacts sometimes...and it is certainly MUCH more expensive than the old, simple gear. Hope this helps. C.U> on the bands.

>>catalog with specs? Thanks in advance.

>They don't make Ham gear. Lots of people just convert their gear to ham bands

Not exactly. They don't actively market ham gear, but they make plenty of equipment that works on the ham bands without any modifications. Almost all of their current generation VHF and UHF radios have some ham-band capabilities. True, there are models that don't, (e.g. 800 MHz radios, low-split 30-40 MHz units, etc.), but for 2m and 440, there are lots to choose from.

If you don't have any friends that work for Motorola, your next choice should be to just call your local Motorola dealer. The prices they quote you are quite negotiable, although they won't tell you that. Markup between what they pay and what they will quote can be as high as 100% on some items if you're buying just one unit.

That's not to say you're going to get a Motorola radio for the same price as a ham rig. For example, a fully-loaded MT-2000 (high-end HT) will cost about 4 times as much as a typical 2m HT, more with accessories. But it will probably last a lot longer, have better audio, a better receiver, perform better, and be usable on other services. The last few ham HT's I've had have all died early deaths due to drops. I will never spend another $400 for a ham-grade HT. I'll put up the money now and have the radio for a long time. But hey, that's just me. Your milage may vary.

Some of the older equipment (and some of the newer ones too) don't work on the ham bands as they come stock, but can be converted to do so, including HT's, mobiles, and repeaters. Older series units, such as Motrac, Mocom, etc. can be had for little money, but you'll have to invest some sweat-equity to move them to the ham bands. If you have the time, experience, bench equipment, and patience, you can do a lot for a little money with older commercial gear.

1226. Rough and Dusty HF Mobile

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-15 01:20:27 UTC
From: flanagan@niagara.Tymnet.COM
Message-ID: <2okq4r$hd5@tymix.Tymnet.COM>
Source record: 227204

We need to put together an HF mobile in an '86 4WD F-150 pickup with big ugly tires and lots of gas tanks. The primary concern is cost, which is limited to $1,000 total.

The primary purpose of this installation will be in-motion and portable phone support of statewide Amateur public service missions. We will be operating in Nevada, so rough, desolate roads (even off-road), extremes of high and low temperatures and lots of dust are ever-present concerns.

Our current thinking is for an under-dash installation of a Kenwood TS-440S/AT. (We can't use the transmission hump because of the 4WD controls.) We are also considering either a Hustler or Outbacker antenna off the rear bumper.

Questions:

Are these good choices?

What should we expect to pay for a decent TS-440S/AT?

With a Hustler or Outbacker, would an AT option even be necessary?

What have we forgotten to consider?

Thanks. . . .

Dick

I knew someone that also had problems with a Radio Shack HT, I'm not sure what kind it was. I know myself from experience, I had a tandy computer, and it was pure garbage. I'm glad I finally invested in an IBM. I think radio wise, you are better getting
a Yasue or Kenwood. I know this friend had his HT in the shop more than he used the thing. I hope this helped a little.

I would suggest that you call Motorola and ask what they make (if anything).
There was a time that they DID make ham gear for 2 meters. I have two
Metrums which were ham versions of their marine radios. They were crystal
controlled and had 12 channels. At the time they were very advanced in
comparison to the ham 2 meter equipment (drake, swan, etc early 70's.

I still use these 25 watt rigs for Packet since the number of channels
is less important.

I see a lot of Motorola radios for sale on the net, in the yellow sheets and at ham fests. Are there any books available that cover the ins-and-outs of converting them to amateur use? It would be good to know which radios are best suited to amateur purposes as well as how difficult they are to convert and what tools/equipment is necessary. Thanks...

I had the same problem with an FX-440 kit. I noticed that the problem was the worst if the board was out of the case and better when it was sitting in the case. I then started poking around on the board and found that pushing down around on the board, I could make it go away. I then bolted it tightly into the case and the problem went away on most frequencies.

I still don't have the transmitter working correctly. People report that they hear the first syllable or two correctly, and then just a dead carrier. A scanner next door receives every word. I've tried two frequency counters, I think it's on frequency. I've tried varying the deviation in small increments from one end of the pot to the other, with the same results. This is about the point where my VHF/UHF skills and equipment give out.

I had fun building the kit, but I don't think I'd get anything this complex from Ramsey again.

>the bands.

There are indeed good old rigs out there, especially tube rigs like
Drake and Collins. There are also lousy solid state rigs out there
from the period before manufacturers started recognizing the unique
problems of solid state and started designing differently to deal
with those differences. Buyer beware. Read the book of QST reviews
carefully before jumping on a 70s vintage solid state rig.

I'd also like to remark that new rigs aren't that much more expensive
than old rigs. The Drake TR4 retailed for $495 in 1967 dollars. That's
$3960 in 1994 dollarettes. That kind of money will buy most of the
top line radios of today. And if you choose an IC-735, you may even
have enough left over to buy a good used car to put it in. :-)

In constant dollars, electronics of all kinds is much cheaper today
than in the "good old days", and much more capable too. Enjoy!

: Andy.

Andy,

Take note!! PLLS are a clever way of using one or more quite stable
oscllitors to produce variable tuning, and increased stability.
They can also be used as a very good FM demod.

They basically take in a signal compare it to a reference signal and put
out an error signal. If used for demod the error signal is your audio. The
error signal is often used to control a voltage controlled oscillator thus
you can get the osc to lock to another signal.

The prescaler is a device that divides down the incoming signal to a rate
that the pll can handle.

Mixers require two signals as they mix the two signals together to make other
more useful signals.

However I suggest that you leave well alone. If you don't understand these
concepts already it would be real hard to design the rx you require.

Message-ID: <2ombo9$qdq@senator-bedfellow.MIT.EDU>
Source record: 227212

I have two Radio Shack FM-VHF Business Radios (model no BTX-120) and I am stuck with it. I want to
convert it to ham radios. Any suggestions? Is it even possible? It currently has two channels and one channel is set at 154.600 Mhz and the other channel does not have the crystals put in. Can I just put in a crystal for 144-148 range and use it as a ham? This sounds too simple.

Any help would be greatly appreciated.

p.s. If you want to buy these radios let me know. (I'll let it go for $150 /pr or $80/ea)

Changes: new mailing lists, .packet rmgroup, and .policy updates

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 18 September 1993 to add the mailing lists for the new rec.radio.amateur newsgroups, to note the rmgroup of rec.radio.amateur.packet, and to officially retire some (in)famous threads of discussion on rec.radio.amateur.policy.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began to dominate other topics in the group and on the list. This resulted in the logical solution: a group was created to hold the packet discussion, and another corresponding mailing list was created as well: net.ham-radio.packet and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great Renaming essentially unchanged, moving from net.ham-radio[.packet] to rec.ham-radio[.packet]. Readership and volume grew with the rest of the network.

The INFO-HAMS mailing list was originally run from a US Army computer at White Sands Missile Range, SIMTEL20. There were few problems with this arrangement, but one was that the system was not supposed to be used for commercial purposes. Since one of hams' favorite pastimes is swapping gear, it was natural for hams to post messages about equipment for sale to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use restriction, and after some argument, a group was created specifically

for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize

this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, should be removed by September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas,

commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
===========================

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

I've seen this point raised in several magazine articles also. The
gist, which seems reasonable to me, is that as a newcomer to ham
radio, it's more difficult to make a meaningful evaluation of a used
rig. We newcomers just don't have the experience and judgment that
comes from it that some of the rest of you have.

Also, if there is a problem with a new rig, it should (maybe not always,
but should) be more straightforward getting it resolved, particularly
if you paid by credit card.

>I'd also like to remark that new rigs aren't that much more expensive
>than old rigs. The Drake TR4 retailed for $495 in 1967 dollars. That's
>$3960 in 1994 dollarettes. That kind of money will buy most of the
>top line radios of today. And if you choose an IC-735, you may even
>have enough left over to buy a good used car to put it in. :-)

Well, also, bright, shiny, new stuff is more exciting. It seems
like the question is just what sort of budget you have and what
turns you on.

I mentioned in an earlier post that one fellow had made me feel a
bit "guilty" considering a top-of-the-line rig as a rank beginner.
Sort of the idea that you're supposed to "earn" the right to buy
a top rig. Pay your dues. Since then (and since buying my FT-990
which, while not the top Yaesu is nonetheless a very good one), I've
come around on this issue a bit. If it's your money, you've earned
it legally, presumably by some hard work and you want to spend it
on the gold-plated super deluxe model, hey, what the hell, that's
your business!

Don't let anyone work you over, telling you you have to "earn" the
right to buy a top-end rig. Once you've earned the money, you've earned
the right to spend it any way you like. It's nobody else's business.
This is a hobby. It's supposed to be fun. Enjoy yourself!

>In constant dollars, electronics of all kinds is much cheaper today
>than in the "good old days", and much more capable too. Enjoy!

That's really true! Things like 10-key tuning and digital frequency displays, etc., sometimes seem a little magical to a guy like me that last played around with radios when it was all slide-rule tuning! For anyone like me with an advanced case of gadgetitis, ham radio today certainly offers everything you could ask for.

1240. FOR SALE: Bird Wattmeter Stuff

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-15 18:05:21 UTC
From: steinr@ucs.orst.edu
Message-ID: <2oml11$7et@gaia.ucs.orst.edu>
Source record: 227218

I have for sale a 10kW slug for 2-30 MHz.
Would also trade for a 140 MHz slug at 10W or 50W, or a
440 MHz slug at 10W.

Also I would like to sell the waveguide input/output terminals
as well. Again, will trade for standard coaxial terminals.

Please e-mail me with a price you're willing to pay -- and if you
have the parts I am looking for.

Thanks in advance,
Ray Stein -- steinr@ucs.orst.edu

1241. Syntor synthesized?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-15 18:52:35 UTC
From: gc@cen.com
Message-ID: <2omnpj$qai@paperboy.gsfc.nasa.gov>
Source record: 227219

I have had some experience with older Motorola LMRs starting
with converting an FMTR-50D to 6 meters (anyone remember those?)
up through Micors and Mitreks. But I have no experience
with the newer programmable models.

Recently someone posted to rec.radio.swap that he had
a low band "Crystal Unit" Syntor for sale. I had always had the
impression that the Syntor was a programmable synthesized
radio.

Can anyone explain the features of the Syntor? Were
there some early crystal controlled units with later synthesized
units? Or is my impression of these being programmable at all
all wrong? What about Syntor X ?

Note: I can't ask the guy selling the "Crystal Unit" Syntor
anything. Email to the address he posted bounces.

: converting them to amateur use? It would be good to know which radios are
: best suited to amateur purposes as well as how difficult they are to convert
: and what tools/equipment is necessary. Thanks...

Tom: First off, they are easy to convert - both for transceivers and for repeaters. There are several sites on the internet with copies of articles on converting the Micors etc. The QRZ Ham Radio CD ROM I got recently at a swap meet had quite a few reference articles on the subject on it.

Retuning the beasts is the only tricky part. Invest in the service manual from Motorola - usually in the $25 range - and save yourself LOTS of trial and error. A service monitor is a real help, but can be fooled. I use my duplexers for my repeater to filter the output so I know by the watt meter when I have the tuning on the right peak and not one of the other images :) That method has not failed me yet.

You absolutely can not beat the quality of the Moto rigs - both in signal and in audio quality.

I am old and my mind is half gone, but I don't think the kind of modulation,
Plate vs Screen, directly effects the way AM sounds. That depends on the
quality of the audio preamps/amps/etc...
Plate modulation used to be preferred to screen modulation, way back when
I still had a mind, because it was more efficient, that is, you got more
power out of the same size final amplifier tube.

Doug --

This is an answer to a dumb question you didn't ask (and one that I should have been smart enough to ask, but wasn't): When you're doing the wiring, be aware that the custom is that the wiring is done so that you make the "dits" with your thumb, and the "dahs" with your index finger (at least if you send right-handed). In other words, the lever that sends the "dahs" is the one on the right, and the one that sends the "dits" is on the left.

I wired mine backward, which presents no problem at all when I'm using my own keyer, but it's absolutely impossible for me to use one that's wired the normal way. As problems go, that's not a big one, but it is an irritant. I know one other ham who did the same thing, and he has also been unable to learn to send the "normal" way.

If you have trouble locating the proper transformer, try using a
small 6 volt filament power transformer (or half of a 12 volt
center tapped transformer). Connect the 6 volt side to the speaker
and the high voltage side to the tube.

You can usually find audio output transformers in old junk tube TV sets
too.

IMHO it is a very good antenna but it won't replace a tri-band beam. I have mine
up 10 feet on the eve of my house and it works very well. I understand that they
work well at the top of a tower. Next to a tower I would expect problems. I
took mine down and used it for feild day and it preformed very well at one
point I was working 20 meter CW and the tri bander was work 20 phone and
we did not interfer with each other.

I would put it up and see how it played.

Nope. The very best radio for @$160 (being reasonable here) would be a
used TenTec Century 21.

Now if you are talking brand-new-in-the box, I personally can't think of
any other HF tranceivers availble for that price. I have a 9040 and it
is VERY nice. Works GREAT with the new Radio Shack DSP unit too.

x9> I am studying up for my technician no-code exam, do any of you
x9> know if there is a waiting period from the time I take the exam until
x9> the time that I can begin transmitting? Also, can someone out there
x9> tell me where I can find out the dates and locations of the exams? Any
x9> and all help would be greatly appreciated.

You can't transmit until you actually recieve your license with
your call sign. Depending on where you are, that's typically 6-10
weeks. If you'd like to find out where the tests are, call or visit
Radio Shack or any other store like that and ask. Many of them have
fliers that give info on tests, and some of the employees are hams
themselves and could get you the info you need. Also, if you're
interested in the HTX-202, I'd go ahead and get it while it's on sale.
It's at a great price now.. then if you get the radio, you can just
listen to others on the air discuss exam dates (It happens all the time
here). It'll also give you a feel for the band before you actually
start transmitting. Hope this helps...

... Take my advice, I don't use it anyway.

1256. Screen voltage for pr. 4cx250B's on 2M?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-17 15:53:11 UTC
From: dgf@netcom.com
Message-ID: <dgfCoEuso.pq@netcom.com>
Source record: 227234

I was fortunate (!) to acquire the RF deck from a push-pull pair of 4CX250Bs on 2M, built verbatim from an article in Feb. 1964 QST. The P/S was in pieces and I decided to build a new one. Most screen supply design's I've seen are regulated (the unit here had VR *tubes*). I can VR with tubes, string of zener diodes, (presumably) a pass transistor linear regulator, or just build an unregulated supply with excess bleeder resistor dissipation. How important is regulation on the screen supply? I've seen screen voltages for this kind of tube from 200V to 350V --- how do I pick the best value? Plate voltage will be ~2200V under load. Advice & comments appreciated! 73 Dave WB0GAZ dgf@netcom.com

1257. Info on Ham for an interested could-be HAM

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-17 16:13:26 UTC
From: jdick@oldhagbug.win.net
Message-ID: <48@oldhagbug.win.net>
Source record: 227235

First off let me say I am currently a Cber and I enjoy it. I hope that doesn't influence any of you hams in the wrong way as I understand there is some adversity between illegal CBers and ham operators. Nuff said bout that lets get down to picking your ham brains for info!

I have heard much about ham operation that interests me. I don't know if all of what I will type is true or not, but that's what I'm here for.

I have heard that on ?2 meters? and a "dial-pad" you can connect up to a ?repeater? and make local phone calls? Do you need to belong to any club to use someone elses repeater? Can anyone copy your "phone" conversation? Is this an alternative to Cellular? Does the new no-code (I don't know morse, but I could learn if I had to) allow this band and.or this type of communicating?

Here is one that should stir many opinions. On 27Mhz we get alot of skip and it destroys local communications. Although it is illegal to talk skip (I have read) sometimes it is fun and sometimes it is aggrevating. So, what is the best ham band to use to avoid skip? What is the best ham band to talk skip? I hear skip on ham is legal. Is it? I would assume 10-meters would be a good skip area because of it closeness to CB freqs. Again am I able to use these bands with the no-code?

Do ham radios usually cover many ham bands? Will one antenna cover many ham bands? What is a good starter radio? What would you expect me to pay to enter the ham arena? Bargain shopping and all. I need radio and antenna, unless I can use my existing CB antenna, wishful thinking on my part probably.

Obviously I have a computer and I have heard about ?packet? radio. What is this? What band is this done on?

I think that covers all that I can think of now. If you have anything to add please feel free to put it in words and type your fingers to the bone. Looking forward to your responses!

I think messages should be posted and not e-mailed in case and other interested passerbys happen to want the same information.

Thanks in advance for your help.

1258. HT with extended RX (and the winner is . . .

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-17 17:16:54 UTC
From: gdallal@world.std.com
Message-ID: <CoEyo8.G8p@world.std.com>
Source record: 227236

And the winner is . . . the Standard C558A, even though it lacks the Yaesu FT-530's lighted keyboard and dual in-band receive and cost $120 more.

I was *all set* for the Yaesu. It had many attractive features missing from the Standard, and while some intermod problems had been reported, I decided they weren't critical because, while I work in Boston, I live outside the city. Other hams have Yaesu's and argue that where intermod is most severe (the towers on Route 128) there's no HT that doesn't suffer some intermod. People who wrote to me about Yaesu's were *truly* enthusiastic about their units. The people at HRO were enthusiastic about Yaesu's; even the salesman who admitted he thought the Standard was a better unit had a Yaesu on his belt (he bought it before the 558A was available). The unit clearly had a nice set of features, the best bang for the buck, and was manufactured to high production standards.

The choice was clear. Get the Yaesu. The lighted keypad was a big plus. The dual in-band receive had important consequences for scanning as well as for hamming. If intermod turned out to be a problem, I could move up to the rumored Standard when it came out and would probably take a smaller financial loss selling the Yaesu than the Standard (if, in the meantime, one of my sons didn't get licensed and get the unit as a hand-me-down). My credit card was in my hand.

But there was one *little detail*. As I reported publicly and mentioned privately, I was going to compare the HT's against my PRO-43 to see how they functioned as makeshift scanners. As luck would have it, HRO had a used FT-530 for sale, and *it had been modified for extended receive*.

It is illegal to listen in on cellular frequencies, but, I believe (and others more knowledgeable should comment) one exception to the rule is for the purpose of antenna testing. So, we set the volume and squelch on the Yaesu and the 43 and got ready to see just how many transmissions each would lock on as we went up the band.

No company publishes specs for out-of-band behavior. Even though the Yaesu has steps of 5, 10, 12.5, 15, 20, 25, and 50 kHz in band, in this particular range it would allow steps of 12.5 kHz only.

This is a political issue for me. It is illegal to listen to cellular, so I do not listen to cellular. However, I, along with many others, believe that this law is foolish and inappropriate because if signals pass through our bodies, we should be free to listen to them as we please. (Some would say we should be free to do *whatever we want* with them.) I also think there is a good chance that as soon as this law is tested in federal court it will be found unconstitutional. For this reason, I do not wish to own any equipment that has been permanently crippled like the FT-530, if an alternative is available.

As far as I can tell, the Standard is not crippled this way. Its steps (the same as the FT-530's) appear to be available for out of band RX. And so I purchased a 558A.

If I acted too hastily, it's only that I probably should have given the IC-W21AT some further consideration. Having decided earlier that the FT-530 overshadowed the W21-AT, I neglected to move it back to the list of possibilities when the FT-530 was eliminated. The W21AT, too, has lighted keyboard and dual in-band receive. I didn't check out-of-band step sizes, though.

>I have heard that on ?2 meters? and a "dial-pad" you can connect up
>to a ?repeater? and make local phone calls?

On the 2 meter band, repeaters are quite popular. These are special-purpose radios, mounted in advantageous locations with good antennas, that receive and retransmit weak signals. Mobile and portable 2m ham rigs talking to each other ("simplex") have a typical range of maybe 0.5 to 10 miles, depending on the antennas available. Going through a repeater can increase that range to 30 or 40 miles or more. Linked repeaters can give hundreds of miles of coverage.

Many, but not all, repeaters have "autopatches" which can make phone calls.

>Do you need to belong to any club to use someone elses repeater?

Sometimes. Many repeaters are "open", meaning anyone can use them. It's considered proper to join the club supporting a repeater if you use it often. Repeaters are expensive and hard work to operate.

Autopatches are less often open. (A repeater can be open but have a closed autopatch.) For autopatch access, it's usually necessary to join the club that operates that repeater.

>Can anyone copy your "phone" conversation?

Yes. A popular repeater probably has a couple dozen hams and maybe another couple dozen scanner owners listening to every conversation.

Ham radio rules are set up so that anyone can copy any conversation. Secrets are forbidden.

>Is this an alternative to Cellular?

Maybe. Autopatch phone calls have to be kept short, whereas cellular calls can be as long as you want. Autopatches are less private than cellular. You have to be in range of a repeater on which you have autopatch acces. No business use is permitted, period.

Cellular is plug-and-play; autopatches aren't.

>Does the new no-code (I don't know morse, but I could learn if I had to)
>allow this band and.or this type of communicating?

Yes.

>So, what is the best ham band to use to avoid skip? What is the best
>ham band to talk skip?

Hams have many bands available. There are also many different ways to
"skip" from one place to another, and each band has its own characteristics
for long-distance propagation.

In general, the higher-frequency the band, the less often you will see
long-distance communications happen by accident. 2 meters, 1.25 meters,
and 70 centimeters are popular bands for local communications.

For ionospheric reflection, which is probably what you are seeing on
11m, the choice of the best band changes with the sunspot cycle, the
time of day, and conditions of the sun's surface and earth's upper
atmosphere.

>I hear skip on ham is legal. Is it?

Yes, quite legal, as long as the ham is operating within the
frequencies allowed for his/her license. Some hams really get into
long-distance communications, called "DX". There are even awards for
making lots of DX contacts.

>I would assume 10-meters would be a good skip area because of it closeness
>to CB freqs.

It is a good band for skip during the strong part of the 11-year
sunspot cycle. We're on the declining edge of the cycle right now, so
10 meters is not going to be very good for DX for another 5 years or
so. There are lots of other bands that can be used for DX, however,
and there will always be freak occurences that will open up 10 meters.
My first HF contact, a few weeks ago, was a conversation from Ohio to
California on 10 meters. That is fairly respectable for a new ham using
a "dead" band. :-)

(To give you an idea of what is possible, my second contact ("QSO") was
with a ham in Spain on 20m morse code.)

>Again am I able to use these bands with the no-code?

No. The no-code Technician license can use 6 meters, which has a wide
variety of unpredictable propagation modes, but you need morse code in
order to get onto 10m and below, where world-wide communications is
common and somewhat reliable.

If you spend a couple of weeks with code tapes and learn 5 WPM morse
code, you can get onto 10 meters voice and 80, 40, 15, and 10 meter
morse code. You can do worldwide communications with these bands.

>Do ham radios usually cover many ham bands?

It depends. Commercial rigs for HF (the bands that get ionospheric
skip) tend to cover all HF bands. Rigs for VHF and up often handle
only one band, or sometimes two. It's also possible to buy a rig for
one band and hook up a converter to use it on other bands; hams who are

into VHF, UHF, and microwave do that a lot.

>Will one antenna cover many ham bands?

It depends on the antenna and the bands in question. The answer to this question is "maybe", and that's final. ;-)

You may be able to use your CB antenna for 10 meters, but if you're going for no-code, that won't be very useful.

Hams often build antennas. It's not too hard to put up a good antenna for $10 to $30.

>What is a good starter radio? What would you expect me to pay to enter
>the ham arena?

Your choice of start radio depends on which bands you plan to work.

>Obviously I have a computer and I have heard about ?packet? radio.
>What is this? What band is this done on?

Packet radio is, in essence, building a network using radio links. There is a lot of room for experimentation here! Packet activity occurs on all bands, but most of it is on 2 meters.

There are some good books about ham radio out there. They answer all of these questions and more. Look for them in your local library, bookstores, ham radio stores (most are pretty friendly), or Radio Shack. Watch out for older books in the library. While they get the idea of ham radio across, the license requirements, procedures, and privleges have changed a lot in recent years.

Another good way to get information is to find some area hams. Ask around and some may surface, or just show up at a meeting of a ham radio club! You'll probably find someone friendly who can help you get into ham radio.

I use a Motorola System Saber, and I never get any intermod. In fact, I've been on a 50+ story building that had radio/commerical/paging transmitters on it and was able to talk to someone simplex without an antenna. If you want quality, don't buy Amateur Radio Japanese crap.

Ken-wood, would you?
Standard, NOT.

I love mine. It is more expensive than other radios, by the time you add
the optional faceplate. Still the controls are complete and pretty easy
to use. The only thing that I do not like about Standards radios is that
there is no way to write a memory chanel to the VFO. This is a problem
with both the C5608DA and the C5718DA. I have both.

FLANAGAN

The '440 would no doubt do the job, but I just had to put in a plug for
my Icom IC-730. Getting a little old, but mine is going strong after
over five years of exclusive mobiling (including maritime). They're

built like a tank, are very forgiving of SWR problems and best of all, not too expensive. Expect to pay about $450 for one in good shape. Drawbacks: no FM (for 10 meters), no 160 meters.

Antenna tuners? My recommendation is don't use one. TUNE the antenna instead, and then match it's impedance with a simple L network. Any ARRL antenna book will tell you how. Using an antenna tuner to compensate for a non-resonant, non-matched antenna is going to waste power. On 20 through 10 meters, one setting of the antenna will cover the whole SSB part of the band. On 80-40 meters, it won't, but a small roller inductor with reversible DC motor will do the job just fine. A couple of microhenries is all that's necessary, plus an SWR meter, of course. Connect it between the matching network and the antenna, not between the matching network and the coax.

HF mobile is great! Have fun...

From: rdm@christa.unh.edu
Message-ID: <2ot9vm$2nv@mozz.unh.edu>
Source record: 227246

I would like to purchase an O-scope for general use. I would prefer a 40 to 50 MHz dual trace scope. However, I don't want to spend a small fortune, nor do I want to get stuck with a boat anchor. (I already have plenty of those in storage :) I've been looking through surplus catalogs as well as _Popular Electronics_. Everything listed in the surplus places seems like overpriced antiques.

In the May issue of _Popular Electronics_ there are several brand names listed that I havent heard of, but would fall into my price range.

(all of these are Dual Trace)
Alplab has a 25 MHz D.T. scope for $315.
Kelvin lists a 20 MHz for $385, and a 40 MHz at $655. the latter is said to have delayed sweep, is this a useful feature?
Elenco has a 25MHz for 349, and $100 more gets you delayed sweep.

Finally, Elenco also offers a Digital storage scope good to 20MHz, switch-able between Digital and Analog. This goes for $730.

I've had some experience with digital scopes in the past, and like the ability to capture a waveform.

Given these choices, (or feel free to provide alternative suggestions) which is the best scope for the money. And, should I stay away from a particular brand?

Thanks for you feedback.

Source record: 227250

I am looking at buying a Kenwoord 632, 633, 641, 741 or 742. What are the tradeoffs of using a duplexer vs. using two antennas? Would I be sacrificing the capability to use crossband repeat? Will these radios do in-band repeat and will a duplexer foil that idea? I do know the obvious tradeoff that a dual band antenna is typically less efficient than two singles. Thanks...

>OBSERVATIONS THAT THEY MIGHT BE ABLE TO MAKE ON SUCH A UNIT ?

I purchased a new one and kept it for a while and absolutely hated it. The SSB is dirtier then anything else on the market (suprios emssions only 28 to 32 db below fundamental, ack! cheezy). If you decide to run it with an Amplifier, hope you have very co-operative neigbours. The power supply I got made noise and I sent is back and they send me a new one. Still the same (seem like power supply have bug) after changing it couple of times.

The worst part is that the RIT/XIT knob cannot be made worst. There is no center detent so if you have to look at the display to center is to 0.0 if you don't like to turn it off and there is not clear button either as it used to be with 940 (reserved for 950 of course). The main tuning knob is worst than in any rig in its class (for example FT-990 or IC-765). I can't believe that they put such a cheezy tuning knob on a $2k+ rig and get away with it. I dumped my TS850SAT after few months, take a loss, get the FT-1000D and never regreted it. What happens to Kenwood of yore years when it used to be the King (TS-940). Don't even think about TS-450. Its dynamic blocking range is less then few home-brew rigs from 1960s, ouch!.

The good things about the radio. The reciever is very good with extremely fine tuning.(actually better then the 950S and 950SD. The 950SDX has pretty much the same receiver as 850) but fell little short to FT-1000 or 3rd order intercept (you can tell the difference if you listen them side by side). Perfect rig if CW is your thing (perfect FSK, better then my FT-1000D) but lousy if your heart is into SSB. For that get you probably need the 950 but 950 is a nightmare to operate (you will alway keep the manual handy even after ten years :-) better yet a FT-1000 or something from the ICOM line.

If you got to get the TS850, don't purchase the matching power supply. There can't be anything worst then that (if there is I like to take a look at it and HEAR it :-).

Hope this will be of some help.

Tanvir
WN1P/3 (Living now in the state of PA).

I could not find any difference betwwen NR and SSB modes except for
some variation in selectivity in medium or narrow modes. There was
not any noise-reduction action. Caould anybody comment on
it? I assume that a good DSP in NR mode cancels (at least partly)
repetitive or white noise.

1279. DualBand Mobile extended RX capability (220band?)

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-18 20:30:36 UTC
From: svec@rtsg.mot.com
Message-ID: <2ouqlc$or@delphinium.cig.mot.com>
Source record: 227257

I have been looking at all the current dual band mobiles on the market
trying to learn which ones do some or all of the following transmit and
receive ranges. In essence, what amateur dual band mobile, also makes
the best broad-coverage receiver. Is anyone aware of a similar study
that may have been put out on the net or if not, I would appreciate
e-mail from the net as to what radios you may own and what their capabilities
are and I will publish a summary in a week or two.

TRANSMIT in 2M/440 ham bands

RECEIVE 108-136AM aircraft
136-174FM public service, etc
440-450FM ham band
450-480FM public service, etc
850-865FM public service repeaters/trunked
869-894FM cellular
920-928FM ham band & other stuff
928-950FM more public 2-way

Also, I heard someone discussing their 2M/440 dual bander could be
modified to also receive in the 220 band but I was listening on
a scanner at the time and could not jump in and ask what radio
he was talking about.

Currently, I am looking seriously at the Alinco "600" but would be
curious what other Kenwood/Icom/Yaeusu/etc may also have extended
receive like the Alinco does.

In addition to the extended receive coverage information outlined above,
I am similarly interested in the cross-band repeat functions which most
new radios have today and how well they work.

Thanks for any and all advice/help... Larry

I guess this implies he doesn't read this newsgroup frequently? :-)

The Smiley Antenna company manufactures a 2m 5/8w telescoping antenna for a HT (probably for 220 and 440 also). HRO, AES and probably a number of other ham stores carry it (or can get it). I've seen 'em being sold at the ham swap meet.

Personally, I'd opt for the 1/2w variety; shorter antenna, seems to perform better than the 5/8w counterparts (reasons other antenna gurus can probably provide, one being a 1/2w does not require a ground plane whereas a 5/8w does, etc.).

MaryMac is one...800-231-3680 / 713-392-0747 in Katy, TX. They discount
everything in the RS catalog...so when RS has a sale, so does MaryMac
(last I saw, the HTX404, the 440 version, was on sale by RS at $228.88 and
MaryMac had it on sale for $209 and some change.)

I recently purchased this dual band mobile and discovered a problem
which I felt must be a defect. I tried to return it to the dealer, who
responded that all-of-em do this...
The problem is that when listening to a station on 440, anytime the
channel changes on 2mtrs, you get a rather loud click in the speaker.
This is a real problem if you try scanning. If you have one, does it
do this also? (As a side note: be sure to ask your dealer about their
return policy before purchasing any equipment. I have seen an attitude
that once you bought it, its between you and the kenwood warranty department.)

Hi Ignacy, nice to work you on 40 a couple of weeks ago. By now, you should have the QSL card. So, I take it you have purchased the Radio Shack DSP filter and were not too happy with it? Like the original poster, I was all set to buy a Timewave DSP 9, until I heard of the Radio Shack device. But it sounds as if the DSP 9 might be worth the extra money.

I purchased a Kenwood TR-7625 at Auction. It is a synthesized 2M rig, and is working. I need a manual for it. Looks like it was built between 1975 and 1980. It has no DTMF, and I would like to have suggestions on a microphone with a DTMF pad and encoder I could put on the radio. The microphone connector is a five pin style. I called Kenwood, they have no manuals and have no suggestions on where to go for help.

To any who have a manual, I will gladly pay costs for photocoping, etc. Thanks much for your time. Maybe I can return the favor to you some day.

What are you talking about? How would the "channel" (I assume you mean "frequency") change on 2M if you are listening to 440? Is the 2M side in "scan" mode? I want to see if mine does this so that I can help you out. I've never noticed a loud click at any time, and I have had one side scanning while listening to a QSO on the other band.

There is a BEEP feature available whenever you change frequencies but it has an adjustable volume, is that what you may be hearing?

73 Hope I can help you out, your dealer sounds like a real jerk, just like our local guy, it's an attitude problem that develops because the japanese don't allow any local competion once a dealer is established in an area.

LOOKING FOR: AEA Model PK-232 TNC
==========

I am looking for a used TNC.

In particular I was hoping for a Model PK-232 made by AEA.
It is for my brother who is trying to get into packet radio.
He works in rural Zaire, Africa where communications
are very poor and this would help him out a great deal.

Also, if you know of anything else that might help
him get started, please let me know.

Please reply directly to me by e-mail as I don't
frequent these news groups that often. Thanks...

Larry

The unit is very sensitive to input level. Too low and it does nothing, to high and it overloads. I found that it must be fed from the speaker out (low impedance, high level). It will not work from a "tape" or line level output. The input level should be high enough that the green light flashes almost constantly when there is a voice signal coming through.

It does require some experimentation to get it to work properly.

Mine does not do this, but I have both bands coming out an external speaker.
I normally scan on one band and have the other set to my favorite repeater.
There is a faint noise from the micro or something, but I can't hear it when
the car is running. Have you tried the microprocessor squelch or s-meter
squelch mode to see if you can eliminate it?

Source record: 227274
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.amateur.equipment

I am looking to buy a scanner shortly, and have narrowed the choices to the above listed models (I think the model #s are right). They have the frequency coverage I'm looking for without getting over $350 (the RS model is right at the limit). Does anyone have good or bad experiences with the two models?

Right now I'm leaning towards the Bearcat since I can get it for just over $300. However, I've been told that RS will be having a sale shortly (within next two weeks) and the PRO-43 may be put on sale.

Any comments on the two scanners (or other recommendations in the $250-$350 range) are appreciated.

>~2200V under load. Advice & comments appreciated! 73 Dave WB0GAZ dgf@netcom.com

Actual screen voltage is not too critical unless you are really trying to get
every last watt out of the tubes. Keep the plates below 2KV for best results.

What is more important is that under some conditions, screen current can
reverse, i.e. current flow is OUT of the screen. This generally means that
the screen supply must be able to still regulate with negative current
output. A simple series regulator will not work unless enough "bleeder"
current is added to guarantee that the bleeder current is greater that the
maximum reverse screen current. A shunt regulator circuit is generally
desirable over a series regulator for this reason.

Eimac/Varian publishes some information on this in their data sheets. The
older VHF manuals also covered this situation. Shunt zeners (or VR tubes)
are not such a bad choice after all!

As long as the 440 frequency is not close to the third multiple of the 2m frequency, (147.57 and 442-444 wouldn't be fun) you shouldn't have any problems. My Alinco 570 has a built-in duplexer, which probably isn't as good as a separate duplexer, and I don't have any trouble.

I recently procured some old Motorola mobile radios at a hamfest, model U63HH-1100R. Any ideas on where to get service manuals, schematics, etc.? Any names, addresses or phone numbers are appreciated.

1303. Re: Looking for info on new Radio Shack DSP audio filter

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-19 17:19:47 UTC
From: dragonsl@hebron.connected.com
Message-ID: <2p13rj$rea@hebron.connected.com>
Source record: 227279

Lets see if I can do it CORRECTLY this time and include the text.

I found the NR mode of the RS-DSP to have little effect on either my TS-430 or FT-736 (any band). It could be the noise floor was low enough that there was little effect
I found the SSB mode (carrier reject) to work very well. While monitoring a traffic net on 20M with two carriers on frequency the in/out difference was marked. The unit also eliminated all computer carriers on 6M (a problem in my area).
I also found the three filter widths to work very well. The CW mode also worked very well.
I did note that the sound was much harsher then with the filter out of the circuit. This was due to the AD/DA function of the filter. I have been told that this filter is only 8 bits wide, while the competitors are 16 bits (just like CDs)

Depends on what you want the scope to do, but I think delayed sweep is about
the best thing since flush toilets. Basically, it allows you to expand
a portion of a waveform for detailed analysis.

If it were me, I'd look at used scopes. A Tektronix 453 is still a very
capable unit, fairly portable, and goes out to 60 MHz. I've seen them
listed for $200-300.

-->I recently bought a used Cushcraft R-7 vertical antenna and would like to
-->get opinions on whether it is a good antenna or not. I would like to take
-->my tri-band beam down and replace it the the R-7 if it is a good antenna.
-->It still looks new. I would like to side mount it on my tower but the
-->instruction pamphlet said not to mount near a tower, but was wondering if
-->anyone had tried this?
-->
-->Depending on the feedback I get, I will either use it or sell it.
-->
-->Please E-mail if you have experience with this antenna.

I have owned an R7 for about 2 years and R5 for almost 2 years before it. I got about 200 countries on them. I then put up a tower and a tribander. The tribander is easily 5 to 6 S-units better. Also, remember the R7 has no front/back so you hear everything. On the plus side, I was running 6's and G's simultaneously during the 1993 ARRL RTTY Contest!

Keep the R7 clear of metal objects (and probably trees) for at least 10 feet, maybe more. I had a 2m vertical about 10 feet away which prevented me from obtaining a good SWR anywhere on 10 meters. As soon as I laid the 2m vertical down on the roof, perfect 10m swr curve.

It has withstood 80mph New England winds and the largest snowfall season in Boston's history (this year). SWR curves are identical to when I put it up. The 40m 2:1 SWR bandwidth is small, so I usually adjust just that top section a few inches either way depending on which contest is on (RTTY, CW, Phone)

Can you tell that I like the antenna despite it's shortcomings in terms of gain and F/B? No doubt whatsoever that a tribander is a better performer, but 1/2 wave on 7 bands on one antenna is still nice.

I just received a new catalog from Ramsey. The catalog is a bit slicker than their previous ones and it looks like they've expanded their line quite a bit.

The most interesting item I saw was a new 20M SSB transceiver that comes either in kit form or assembled. Kit price was $350 if I remember correctly. Power ouput is 10W. It sounded knd of interesting. I wonder how it compares to the MFJ rig.

Has anyone seen/used this radio?

Just curious...

--=}>> On 9 Apr 1994 22:01:07 GMT, mrw13@namaste.cc.columbia.edu (Marc Richard Wollemborg) said:

> Has anybody tried both of the above radios and could tell me which of the two
> I should choose? I hear the Kenwood is nice and small, has a great display,
> but is a bit hard to program and does suffer from intermod problems. Please
> email any "votes" or comments. Thanks.

I'm just now shopping for a 2m/440 HT and am trying to make the same decision. The local HRO has the Kenwood TH-78A for $389 and the Yaesu FT-530 for $399, so price doesn't seem to be a factor.

I'm totally new to radio (no license yet), so I'm not sure how much to value the different features, but I have plenty of time to learn/shop.

They can both be modified to open up the Rx and Tx ranges, but it sounds like there are many weak areas as you get away from the ham bands.

After mods, the Kenwood does these:
Rx: 50-180 300-400 400-512 800-950
Tx: 136-180 400-512

The Yaesu does these:
Rx: 110-180 300-500 800-859
Tx: 130-180 400-470

At first, I liked the idea of getting FM Broadcast Radio (88-108) on the Kenwood, but now I read that it's modulated differently (wide-band?) and doesn't come in anyway, so that's out.

The Kenwood has a six-character alphanumeric display & memory, while the Yaesu does not. Apparently, you can get an optional microphone for the Yaesu that does have an alpha display, but I haven't seen it, and I'm sure it's pricey.

The Yaesu has "CTCSS" included while it's an extra option on the Kenwood. I have no idea what that feature does, but radios that have it seem to boast about it. The Yaesu also has some kind of Automatic Tone Search feature that I don't yet understand.

Both radios can do VHF/VHF and UHF/UHF, but some people say that this adds interference.

The Yaesu has 82 memories, the Kenwood 50 (expandable to 250?). The Yaesu has a light-up keypad, and I don't think the Kenwood does. The Kenwood does, however, have some internal video games :-).

I've only been shopping for a few days, and I'm beginning to wonder why I don't see much of the Kenwood TH-78A mentioned in comparisons. The general list of recommended models seems to be: ICOM W21AT, Standard C558, Yaesu FT-530, Alinco DJ-580T with no mention of the Kenwood. Hmmm... Is there some glaring problem with this unit that takes it right out of the running from the start?

I'm anxious to hear what other net.folks have to say about these two models.

>just wanted to make sure

Yes it CAN if you have a UT-50 or UT-51 board in it.
The UT-50 does encode (makes the tones).
The UT-51 does encode and decode (opens squeltch only when tone is
present).

The price difference is marginal. Go for the 51. (IMHO)

1318. [Q] Looking for info on mystery "NAV PAK" device.

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-20 03:48:25 UTC
From: scheer@rtsg.mot.com
Message-ID: <2p28m9$k6h@delphinium.cig.mot.com>
Source record: 227146
Cross-posted to: sci.electronics,rec.radio.amateur.equipment

Greetings,

At a recent hamfest, I picked up a small interesting box that is labeled "NAV PAK", and I'm trying to find some information about it.

The box measures 6.5"w x 8"d x 2.75"h, and has the following things on the front panel :

- Four LEDs :
- "Pwr" (green LED)
- "Xmit" (red LED)
- "Rec" (red LED)
- "Sta" (red LED)

- A green (round) LED (unlabeled).

- A red momentary pushbutton labeled "Load".

- A toggle switch labeled "MDT" in the up position and "Loran" in the down position.

- A funky switch that can be set from "00" through "99" via two pushbuttons per digit. These look like something that you might see in an airplane cockpit.

On the back there are the following things :

- A pushbutton "Power" switch.

- A BNC connector labeled "Loran Antenna".

- A female DB9 connector labeled "MDT Input".

- A female DB15 connector labeled "Radio".

- A miniature headphone jack (ie, earphone jack) labeled "Audio".

- The following text :

Navigation & Tracking
Datacom TNC
Serial # xxx Model 1001

From all this, it looks like this box might be a TNC and/or a Loran-C receiver...??? :-? Whatever it is, it looks interesting. :-)

Does anyone know what this box is/what it does, how I might be able to use it (especially the Loran-C part), etc ??

Feel free to respond via email. If there's enough interest, I'll
summarize and post my findings.

advTHANKSance. :-)

>Can someone tell me if the is a FAQ about buying hams, what to
>look for, and stuff like that.

I don't know about an FAQ, but I know I'm not for sale, and certainly
not for only $250. ;-)

Information about buying a ham radio is certainly a frequently asked
question, but I haven't seen any file of answers to the question. The
first thing to consider is what bands you'd like to be on. That
depends in part on the license you get, and in part on what you'd like
to do. The second thing to consider is what size of radio you want.
The third thing to consider is, given the typical prices for that type
of radio and given your budget, where are the best places to look for
The Perfect Rig?

For the first question, common answers are "HF" or "VHF/UHF". Within
VHF/UHF work, you need to decide if you want to emphasize FM for local
ragchewing, SSB and CW for satellites and other weak-signal modes, or
FM (AFSK) for packet radio. (Similar questions need to be asked for
HF, too, but they seem less important there.)

The second question, size, is only really useful for VHF and UHF rigs.
With HF, there isn't as much variety in size. In the upper bands,
though, you have a choice of tabletop rigs, mobile rigs, or handhelds.
(You can use a mobile as a tabletop or a handheld as any of the
three.) The catch is that, generally, the larger the radio, the better
the performance. A mobile works much better than a handheld, in
exchange for less convenience. A tabletop model is usually all-mode,
which means it can handle the SSB and CW weak signal modes used for
satellite and other long-distance work.

Finally come prices. If you have some idea of what you're after, you
can ask here to see what you can find. For $250, you will be looking
mostly at used equipment, though some new gear is around that price.

OK, 'nough of all that. What's most popular? It used to be that the
classic way to start was to buy an old rig, put up a dipole for 10m,
40m, or 80m, and get on CW. That was when Novice was the usual entry.
These days, the most popular entry-level radio is a 2m or 2m/70cm
handheld. There are some people who argue quite persuasively that a
mobile is a better first choice for a new ham. The choice of which way
to go is up to you. It should be dictated more by your interests than
by what everyone else is buying.

Stephen

Ne> why is the 202 cheaper than 404 ? economy of scale ?

Ne> jerry N3RKD

They may be a little cheaper to build, since many more 202s will be
sold than 404s, and UHF power transistors are a little more expensive.
But whenever I've been involved in marketing/price setting, a lot of
attention was paid to "perceived value." How much will the customer
think this product is worth? How much can we get? What's the
competition selling for? Jack the price up some, and the customers
think they're getting a better, higher quality product. Sometimes.

Source record: 227154

Thanks. I believe I will be going into the 2m area, since all I need is a no code tech. license. I am looking at the RS HTX 202. Seems like it has some cool features, and is going for about 180. Anyone like/dislike this radio for any particular reason. Thanks.

1328. 10m rigs:Uniden 2600 vs 2510

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-20 17:25:31 UTC
From: phybs@mizzou1.missouri.edu
Message-ID: <phybs.81.00116D65@mizzou1.missouri.edu>
Source record: 227167

Not having a 2600 in front of me, I need help with this one. Is the 2600 the same radio as the 2510 except with more bells/whistles ? If so, do the 2510 mods (extended Rx/Tx, power etc) work for the 2600 ? Would appreciate the enlightenment.

Thanks

1333. Recommended Mobile rig?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-20 19:25:17 UTC
From: klaudon@pica.army.mil
Message-ID: <9404201925.AA08634@batdd6.batdd1.pica.army.mil>
Source record: 227160

Now that taxes are paid, I finally have a decent car (93 Saturn SL2), and RS again has the HTX-202 on sale, I am considering the purchase of a 2M rig.

I commute 45 miles between Rockland County, NY and Morris County, NJ. Most of my use will be in the car; however, I am still considering the HT (can't resist toys). I am especially interested in auto-patch use (to let the xyl know what time to have my dinner burned by).

I do not really want to spend much more than the $ 200 that RS gets for the HT; however, if it really would be better to spend a bit more, then I will save up for it.

Questions:
1. Should I stick to 2M, or should I really try to get into a 2M/440 rig? Is the 440 going to become more and more useful in the crowded NY/NJ metro area? Or am I better off sticking with getting a good 2m rig/ant, because of cost factor?

2. Any recommendations as to features that are critical to have?

3. Any recommended rigs to buy, or NOT to buy?

4. Should I look for a used (excuse me, pre-owned) rig at a hamfest to save $$$, or should I just go for it and buy new?

5. I am considering NOT MOUNTING the rig, but instead, getting some kind of backpack, or cellphone bag, and hooking it up each time. Rig will be stored in trunk to help avoid breakin by local indigenous scum.
Does anyone sell anything for this purpose? Will rig be too hard to use like this, so that I should mount it instead, perhaps in a slide-out mount?

6. Someone on ham-ant posted the same question yesterday, namely, since I intend to wimp out and use an on-glass antenna, will the fired-in black dither pattern on the rear glass affect the antenna performance? Any antenna recommendations for 2m or 2m/440?

7. Someone told me once that there is a 6m repeater system, all linked up, effectively connecting all of NJ for good local communications. Anyone know anything about this?

Please reply directly as I want to act soon. Thanks and 73!

1334. Re: Kenwood TH-78A *OR* Yaesu FT-530

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-20 19:58:24 UTC
From: craigb@sdd.hp.com
Message-ID: <2p41h0INNab5@hpsdlgd9.sdd.hp.com>
Source record: 227161
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

I have a TH-78A. I'd like to point out a couple of misconceptions
below:

In article <STEVE.94Apr19184558@hobbes.vigra.com> steve@vigra.com writes:
>The Yaesu has "CTCSS" included while it's an extra option on the
>Kenwood.

This is not true. The Kenwood has both PL encode and decode (the
decode is somewhat useful for screening out intermod.). The Kenwood
does not have PL scan. (BTW, PL and CTCSS are synonyms which
describe the use of a subaudible tone to break squelch on a receiver.
Many repeaters require a PL tone in order for them to key up.)

>The Yaesu has 82 memories, the Kenwood 50 (expandable to 250?). The
>Yaesu has a light-up keypad, and I don't think the Kenwood does.

The TH-78's keypad is lit. This is not true for the single band
TH-28 and TH-48. Note also that the memory capacity is cut in
half if you use the 6 character labels.

Despite some deficiencies, I have been happy with my 78. The 6
character display is a real winner for me. Maybe I just have a weak
mind, but I find it extremely useful to have 6 characters to remind
me what is in each of my 100+ programmed memories.

The deficiencies I have noticed are:
1: Intermod. I live in direct line of sight with, and about
two miles away from a mountaintop packed with commercial
transmitters (Mount Soledad for you locals). Let us say
that it is an RF rich environment. 2M repeaters without
PL are all but useless to me from home. Even the machines
with PL are difficult for me to copy sometimes. 440 is
OK, though.
2: User Interface. Let's just say arcane, complex, nonintuitive,
difficult. I don't know if this is any different than on
any other HT.

The workarounds for the above problems are trivial: I only use 440
at home. I have no intermod problems out in the woods mountain
biking. And I have a quick ref card which describes most of the
things I need to do.

Again I've been very happy with my TH-78A. If you don't care about
the alphanumeric display, the Yaesu is almost certainly as good or
better. If intermod bothers you very much, I have heard that Standard
radios are good in that regard.

Good luck with your choice!

Date: 1994-04-21 08:40:52 UTC
From: a10554@giant.rsoft.bc.ca
Message-ID: <a10554.766917652@giant>
Source record: 227169

svec@rtsg.mot.com (Larry Svec) writes:

>I have been looking at all the current dual band mobiles on the market

Yes, I am doing the same too. But I am still considering a single band
one for cost reason, which some new models can receive AM/VHF and/or
UHF as well.

>receive ranges. In essence, what amateur dual band mobile, also makes
>the best broad-coverage receiver. Is anyone aware of a similar study

One thing to watch out is the buzz word here "intermod rejection". The
more broad-band, the worst/hardest to filter, thus more intermod for
ham-type radios. It is hard to pick out the max. range of the radios
as they are usually not accurate on US mag. reviews and not listed on
their ads. Some of the Japanese mags do list them but I don't have all
the months to make a good list. Usually collection of what people review
here on the net is good, but I couldn't find any archive on ftp sites.

>RECEIVE 108-136AM aircraft
This part is usually listed in mag. ads.
> 136-174FM public service, etc
standard in today's radio now.
> 440-450FM ham band
> 450-480FM public service, etc
probably more or less standard, plus below 440MHz.
> 850-865FM public service repeaters/trunked
> 869-894FM cellular
> 920-928FM ham band & other stuff
> 928-950FM more public 2-way

Not only this is not listed, but the sensitivity varies a lot on the
HTs which have them. A lot of HTs actually can do all of the above,
and I wonder why the mobiles are always a bit less (to have better filters?)

>Also, I heard someone discussing their 2M/440 dual bander could be
>modified to also receive in the 220 band but I was listening on

That is usually very rare and I haven't recalled one. I'll be kinda interested
also, but I don't think so. I also heard some Standard HT can do that, but
I know my C550 (same as C558A) cannot do it.

>Currently, I am looking seriously at the Alinco "600" but would be
>curious what other Kenwood/Icom/Yaeusu/etc may also have extended
>receive like the Alinco does.

What is the range of the Alinco 600? As far as receivers and radios go,
I think I trust Standard best, and Yaesu second. Icom has been best in
the old days. Kenwood seems to attract the most boos for bad intermod
rejection. (but I also heard contrary stories.)

If you need a truly complete list of ftp sites with ham radio related files, type "archie hamradio" (without the quotes) from your main prompt inside your account. The archie server is a bit like a database that searches for whatever your subject is. It will give you a list of ALL ftp sites with ham radio related files or directories. Your host should be connnected to the archie server. Good luck.

steve@vigra.com (Steve Haehnichen) writes:

>I'm just now shopping for a 2m/440 HT and am trying to make the same
>decision. The local HRO has the Kenwood TH-78A for $389 and the Yaesu
>FT-530 for $399, so price doesn't seem to be a factor.

I used to live in SD and has been to that HRO many times, I was back
visiting and visited that store, oh, boy, they have more stuff now :).

>After mods, the Kenwood does these:
> Rx: 50-180 300-400 400-512 800-950
> Tx: 136-180 400-512

I seriously doubt if the Kenwood can lock the PLL (actually receiving)
below about 90 or 100MHz. And also transmitting the full 400-512MHz. The
display might say so, but the VFO and the rest might not.

>The Yaesu does these:
> Rx: 110-180 300-500 800-859
> Tx: 130-180 400-470

Only diff. is the Kenwood can do AM in all VHF and UHF (may be not 800 band)
but Yaesu can only do it in the 110 to 138MHz?? (Mine Standard C550/C558A
can do AM on all VHF but not UHF.)

>At first, I liked the idea of getting FM Broadcast Radio (88-108) on
>the Kenwood, but now I read that it's modulated differently
>(wide-band?) and doesn't come in anyway, so that's out.

Mine picked up quiet passages ok, once the loudness is out (high deviation)
then it's all clipped. Not useful at all.

>The Kenwood has a six-character alphanumeric display & memory, while
>the Yaesu does not. Apparently, you can get an optional microphone
>for the Yaesu that does have an alpha display, but I haven't seen it,
>and I'm sure it's pricey.

Kenwood can also send alphanumeric pagings to other Kenwoods, if that is
good for you. I really like the idea, but since most people don't like
Kenwood due to rumors of bad intermod rejection and hard to use interface,
they are not popular and thus the actual usage is not much besides few who
own it. Yaesu 530 doesn't have alpha numeric, the speaker/mic is a back-
lit display and buttons simpler than on the radio. about $100. The new
Ft-11 micro size single band HT has alpha numeric memory but no alphanumeric
paging. (also by Yaesu.)

>The Yaesu has "CTCSS" included while it's an extra option on the
>Kenwood. I have no idea what that feature does, but radios that have
>it seem to boast about it. The Yaesu also has some kind of Automatic
>Tone Search feature that I don't yet understand.

I think almost all HT sold in US includes CTCSS encode and decode while
most mobile/base only includes encode and decode is optional. CTCSS is
(depends on whom you asked :) Continuous Tone Coded Squelsh System, aka
sub-audio tone, also called PL (Private Line) by Motorola, or Select Call
by GE. It is from about 67Hz to about 250Hz selectable from a table to
key up repeaters to open squelsh on others' radios.

>Both radios can do VHF/VHF and UHF/UHF, but some people say that this
>adds interference.

Yes, as it is using the other band receiver to receive far away, thus
weakening the filter job/design. Currently there is no good cure except
they put in multiple switched filters.

>The Yaesu has 82 memories, the Kenwood 50 (expandable to 250?). The
>Yaesu has a light-up keypad, and I don't think the Kenwood does. The
>Kenwood does, however, have some internal video games :-).

One BIG reason I refused to buy the Kenwood as if I need a video game,
I can get something else, even to download one for my HP48SX prog. calculator.
If there are space left in the Kenwood uP rom, why don't they put in something
useful? like calculating/estimating remaining time battery usage, may be
even some memory management software.

>The general list of recommended models seems to be: ICOM W21AT,
>Standard C558, Yaesu FT-530, Alinco DJ-580T with no mention of the

They all have merits, but the only one I would buy (again) is either
the Standard (which I have a similar model) or Yaesu. But W21AT has
the cellular phone style microphone being lower in the battery area,
which is nice doing phonepatch. Alinco's only merit is lower price.
Kenwood if you want the latest alphanumeric functionality (which I really
like to have, but not at a sacrifice of other areas.)

In article <2p41oq$6as@hp-col.col.hp.com> jwc@col.hp.com (John Chapman) writes:
> I thought "duplexers" were used with repeaters with cavities.
> and "diplexers" were used for combining transmitters and antennas. ?????????

That's almost the common usage, but a filter/combiner is a filter/combiner.
Diplexers are commonly used to allow two radios, or two sections of
one radio, to share a common antenna, but of course they can be used
the other way to allow one multiband radio to use two different antennas,
usually on two different bands. A duplexer also allows one antenna to be
used with two radios, or two sections of one radio, or vice versa as with
the diplexer. The operational difference is that the term duplexer is usually
applied when the combining/splitting is done in a *single* band, while the
term diplexer is most commonly used when the split is *between* different
bands. IE a duplexer usually must meet more stringent requirements than
a diplexer.

1348. Comments on the new OHR "Classic" 20/40 meter QRP transceiver?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-21 14:24:43 UTC
From: rossi@VFL.Paramax.COM
Message-ID: <1994Apr21.142443.18991@VFL.Paramax.COM>
Source record: 227176
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment

Just got the latest OHR catalog and it shows their new 20 *and* 40 meter
dual-band QRP transceiver. I talked to them on the phone and they claim
it has similar performance to their "Sprit" transceiver but is dual-band.

Looks pretty nice. Anyone out there build one yet? Comments?

1349. Do automatic ant. tuners often wear out?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-21 14:27:57 UTC
From: smiller@intelsun.rus.uni-stuttgart.de
Message-ID: <2p62hd$1v21@info2.rus.uni-stuttgart.de>
Source record: 227177

I have a new Yaesu FT-890 with a built-in antenna tuner. It's a fine rig and I really like being able to tune around, change bands, etc. and always be "ready" to transmit.

But I tune around a lot, and I hear the antenna tuner motors purring away, constantly tuning and re-tuning my antenna as I scan the various bands.

So my question is directed to automatic antenna tuner owners: are such tuners known for wearing out and/or failing often? If so, then maybe I'll disable it at all times except for when I'm about to transmit, but it's such a luxury to NOT have to do that, that I thought I'd ask if anyone else has had problems.

Please email me. I'll post a follow-up if there's interest.

Thanks,

1350. FT-290-II sensitivity upgrade kit?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-21 14:28:58 UTC
From: robs@blade.stack.urc.tue.nl
Message-ID: <2p62ja$m2k@tuegate.tue.nl>
Source record: 227178

I recently started using an FT-290 mark II portable transceiver for mobile use
instead of a FT-480 (which is under surgery because of mysterious
malfunctioning) and it seems to me the FT-290 is much less sensitive to
weak signals. I heard from owners of the original FT-290, so to say the
mark I, that there was a PCB available in those days, to improve sensitivity
of the unit. Holes were pre-drilled in the unit, and the PCB fitted in there
as if Yaesu forgot to put it in during production, and sold it as accessory.
Does anyone know if the same goes for the FT-290-II? Is there an upgrade PCB
or do I have to have my rig realligned?
Any info and/or suggestions welcome.

1351. WANTED: power plug for ICOM W21AT

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-21 14:50:08 UTC
From: alan@manila.cc.columbia.edu
Message-ID: <2p63r0$gr3@apakabar.cc.columbia.edu>
Source record: 227179

I have been trying to find a matching power plug for the ICOM W21AT
for less than $15 which is what HRO (and I'm sure others) sells ICOM's
molded plug connected to a few feet of wire for. One would think I could
find such an item for $1-2. I have tried Radio Shack and it appears that
none of the half-dozen or so coaxial power plugs that they sell fit.
I am in the New York City metro area so, if a local store carries this
I would appreciate hearing of that, else I'll mail order.

I'm getting real tempted to slice the plug off my battery charger:-)

Ar you sure that the noise filter works? Perhaps a difference that
you heard were from different bandwidths of NR and SSB modes.
According to another ham, a discussion with RS DSP developers on
Compuserve revealed that RS DSP has no NR function to keep the price
down. Then, descriptions of NR function would be just a misleading
marketing.

1355. Radio Shack's New DSP Filter

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-21 16:30:00 UTC
From: MUENZLERK@uthscsa.EDU
Message-ID: <2DB6AC9A@msmail.uthscsa.edu>
Source record: 227183

I recently purchased the DSP-40 from Radio Shack. I have had the Timewave DSP-9 for
some time now. Is it worth the extra sixty or so dollars? I would say no. The DSP-40
will do most everything that the DSP-9 will do with fewer switches. I think it is only an
8 bit processor but that only limits its audio dynamic range. Here is my humble
evaluation of the DSP-40 using a Yaesu FT-890 as the receiver.

Good Things:
1. It is cheap, $80.
2 . The notch on SSB and Noise reduction mode is very good, maybe not quite as fast
as the DSP-9 but fast enough. Once it locks on a carrier it is gone. You can
retune your rig and it tracks very quickly, in about half a second or so.
3. Both the CW and SSB bandpass have very sharp cutoff. The CW has a very narrow mode
that doesn't ring, even in high noise situations such as 160 meters.
I was impressed with it. It is a bit strange to see your S-Meter jumping at around
S-9 or higher while you receive a weak signal.
4. The NOISE mode works quite well to remove the harshness from the background noise on
the lower bands (40 and down). My receiver is pretty good at doing that anyway so
I was not really impressed with the noise filter.

Not so Good Things:
1. It requires a hefty power supply, 750ma or better at 12 volts. It states that it will
work with 500ma but don't try it. The poor little adapter gets pretty hot.
2. The audio input level is pretty critical. You must adjust the audio input so that it is just
right. If you don't, either the filter will not work properly or you will get significant
distortion. This is probably because of the 8 bit processor, not a big problem.
3. No low-level audio input. You must use the external speaker output on your rig if
it has one. You can use the headphone output but the audio level must be set so high

that it will blow you out of the shack if you forget to turn it down
before you unplug
the jack.
4. It does produce a little RFI but it will filter out any RFI that it
creates. I think
that a metal case instead of the plastic one would fix that.

5. BIGGEST COMPLAINT: IT HAS A MONO HEADPHONE JACK!!!! I think that every
rig on the market
(at least the newer ones) will accept stereo headphones. They couldn't
have spent that
extra fifteen cents or so and put a stereo jack in the silly thing!

Overall it is a pretty good piece of equipment. I think that they could
have included an AC
adapter with it.

1357. DJF1T BatterySave problem - anyone else have it?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-21 16:47:21 UTC
From: jgates@hebron.connected.com
Message-ID: <jgates.766946375@connected.com>
Source record: 227184

I shoulda had Alinco fix this earlier under warranty as it was in the radio right out of the box when I bought it new.....ah well:

The radio is supposed to cycle about once/second between normal 70ma current drain and 30ma low battery save drain. It is supposed to spend about 70% of the time at 30 ma. This of course when you invoke the battery save mode.

Mine and another guy's cycle about once/15 seconds and spend only about 10msec at the 30ma drain - the other 14plus seconds at 70ma. And it produces a "clunk" in the speaker when it changes over. Does this reliably - not an intermittant condition.

About the only way you would know this is going on is if you hear the "click" in the speaker - unless you went and used a scope on it as I did.

Alinco says: "nah - we don't recognize that problem. Send it in - and we'll charge you as it is out of warranty".

Sigh !

>can do AM on all VHF but not UHF.)

Not True. Although not documented, if you put a UHF frequency in
the left side of the FT-530, and enable A3E mode, you will decode
UHF frequencies in AM mode. Maybe not as convenient. Now, HOW they
do A3E detection is a kludge. Look at the schizmos and take a look :-)

: Thanks,
:: 73 MIKE KM4QN

On mine, the pot is for setting the tone level. The tone freq is
set by shorting pins of the IC to ground using solder blobs.
Lemme know what freq you need and I'll tell you the pattern.

There is a small board inside the back of your unit called a TU-6.
The tones are set on this board by soldering or breaking the
solder connections to the IC on the board (primative, but it
works). The pot on the board is for tone volume. E-mail with the
tone you want and I will give you the solder connections to make
(there are 37 different tones and I am not into that much typing
:-)).

1377. NEW Heliax ("Hardline") for sale!

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-22 14:12:27 UTC
From: kenh@w8hd.org
Message-ID: <2p8m0b$8p2@w8hd.w8hd.org>
Source record: 227103

I have a large amount of Andrew Heliax (hams often misrefer to this as 'hardline') foam coaxial cable available.

Lengths from 30' to 500' are available, as are various sizes (1/4", 1/2", 7/8" and 1-5/8"). All lengths are 'new' (never used tails).

Since this is new cable, this is not a 'fire sale'.....but prices are about ONE HALF of DEALER COST:

1/4" (both 50 and 75 ohm) 50 cents per foot
1/2" 50 ohm $1.00/foot
7/8" 50 ohm $2.50/foot
1-5/8" 50 ohm $4.50/foot

Shipping and COD charges additional, billed at my cost.

Connectors are available to those who purchase cable, but only new, ordered upon receipt of payment, and sold at my dealer cost, plus shipping.

Hi, the number that I have for Motorola parts is 800-422-4210. You might try
your local Motorola dealer too. I've gotten old manuals from mine for FREE.
Can't hurt to ask.

: * NETNEWS FILE ** Discarded or Received **

Hello,

As you probably know, most amateur 2-meter handhelds (and mobiles for that matter) receive up to 174MHz. They can usually be modified to transmit up there also, sometimes with somewhat degraded performance. The catch here is they are not type accepted by the FCC so it is illegal to transmit with these radios outside the ham bands, even if you have a legitimate reason. Also, most of these handhelds are not preselected so they have poor performance outside the ham band regarding intermods.

The handheld that I use to cover both 2-meters and business band (I do some consulting for some shortline railroads out here so I need to be in the 160 to 161MHz range) is an Icom H16. This radio performs well over the entire range, is type accepted, and is keyboard programmable if you know the access code. (Commercial radios are not designed to be user-programmable.) It holds 16 channels and has built-in scan and programmable DTMF. I bought mine used but I think new they are around $600. You can get them through any commercial radio dealer that sells Icom.

Cheers,

Greg WB6UHH

: I need to adjust the deviation in my Standard 5608A. Does anyone have a
: service manual or know the location of the adjustment? Any information
: would be useful. Thanks

: Ed
: parish@think.com

Ed:

Deviation for VHF is adjusted with R635, which is located under the TOP
cover of the radio in between two shielded boxes (middle left) of the board.

Deviation for UHF is adjusted with R214, which is located under the BOTTOM
cover of the radio next to a small shielded box (middle left) of the board.

You may have to remove the top press on shield cover to gain access to the
VR's.

Muenzler, Kevin (MUENZLERK@uthscsa.EDU) wrote:

: Good Things:

: 4. The NOISE mode works quite well to remove the harshness from the
: background noise on
: the lower bands (40 and down). My receiver is pretty good at doing that
: anyway so
: I was not really impressed with the noise filter.

I just bought one for the heck of it. I have used the JPS and the Timewave and really felt the Timewave was a much better box. Now, I'm very disappointed with the RS version. While it's true, I didn't expect too much for that price, I find the NR function to be ineffective. I can tell no difference in snr with it on or off. I have tried it with nothing but background noise, and also while listening to both strong and weak signals. The RS unit has no noticable effect. When I tested with just background noise, I used impulse, broad hash, and normal hiss. None were effected by the NR mode. I seriously wonder if this unit is defective. On the plus side, the notcher works fine, as do the bandpass filters-excellent.

: Not so Good Things:
: 1. It requires a hefty power supply, 750ma or better at 12 volts. It
: states that it will
: work with 500ma but don't try it. The poor little adapter gets pretty
: hot.

I'm using an MFJ (tnc) power supply, rated at 500ma, and it is running almost cool.

: 2. The audio input level is pretty critical. You must adjust the audio
: input so that it is just
: right. If you don't, either the filter will not work properly or you
: will get significant
: distortion. This is probably because of the 8 bit processor, not a big
: problem.

I did not find the audio level to be critical, however, keep in mind that the NR mode isn't working right anyway. I tried many different levels, including both more and less than what the documentation calls for. At no time did I hear any distortion.

: 4. It does produce a little RFI but it will filter out any RFI that it
: creates. I think
: that a metal case instead of the plastic one would fix that.

I haven't found any (yet), but that doesn't mean it isn't hiding somewhere. I agree, it should have a metal case...something heavy enough to keep it from moving around on the shelf so easily.

: Overall it is a pretty good piece of equipment. I think that they could
: have included an AC
: adapter with it.

Yes! I was really surprised that it didn't have a PS cube. Do they really think the majority of them are going to be used mobile? I think that a very large majority will not.

Thanks for the words, Kevin, and the chance to respond. I really do wonder if this one is defective. I'm waiting to see if they get another one in so I can "borrow" it long enough to see if mine is "normal" or not.

A ham has responed to my query that RS DSP has no NR function at
all, to keep costs down. I wonder why then is NR mentioned in the
documentation and on the box. Marketing?
I think this unit is worth $80 and RS should not mislead anyone. I am
returning my unit because I wanted NR.

BTW, can you write an extended comparison of DSP-(9?, 9+?) and RS?
I think many readers would be interested.

>WN1P/3 (Living now in the state of PA).

Tanvir's '850 had something wrong with it. I have had one for over a year and love it. I have gotten tons of unsolicited "outstanding audio" comments using a $19.95 Radio Shack mike, and have heard lots of 'em on the air with no evidence of splatter. Well, ok, I just remembered I did have to homebrew a preamp for the mike - one op amp, no biggie - the mike amp is a tad short on gain unless you use the factory mikes. The only complaint: would like the noise blanker to be more effective. Part of the reason I bought it was that it has two (count 'em!) blankers, but my little Uniden 10 meter rig in the car has a far superior blanker. A letter to the factory got the usual "gee, never heard that complaint before" answer. Well, then they're not listenting because I have heard other hams on the air with the same complaint. If that were fixed, it would be perfect....!

May I suggest the best general purpose, low cost oscilloscope in the world: a used Tektronix 465B. Ok, I'm a little prejudiced since I worked on the production line for several years (no longer affiliated), but at the time it was the best selling oscilloscope in the world by far, and for good reason. 100 MHz, dual trace, delayed sweep and the sweep trigger system is still regarded by many as the best ever made. Granted, they're getting a little long in the tooth, but if you find a good one, snap it up. You won't be disappointed.

For information, e-mail "andrewthall@delphi.com"

Thanks. Andy Thall,WS7J

1392. Questions - VE?, Starter rig?, Antenna's?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-23 11:54:24 UTC
From: jdick@oldhagbug.win.net
Message-ID: <59@oldhagbug.win.net>
Source record: 227115

I'm sure this is not the right area but this is the newsgroup I subscribe to and I'm sure that you will be able to answer my question.

I am interested in becoming a ham operator. I would like to know how I go about finding a local VE. From there I can contact him/her/other? to find out how and when they schedule testing.

I live in the Norwich, Connecticut area but work in the Groton, Connecticut area.

I have a 2-meter hand held and enjoy listening, but can't wait to rag-chew with the best of them.

Also I will be looking for a starter system preferrably a multi-band base/mobile/?? in the $400-$600 price range. Any heart felt suggestions? New or used works for me. I don't have to break the shrink-wrap so long as it works.

As long as I on a roll... Antennas? I would like some suggests on an antenna. Of course I want the moon ... 160m-10m with one antenna, but is that possible? What is the least number I should need. I have heard that an inverted V antenna is in expensive for many bands. Is this true? Does this type of antenna do well? I have also seen an Iso-Loop antenna that covered many bands. Are these any good. Please keep in mind with all responses that I'm entry level. I know a 400ft tower with a $5000 antenna would be "best" but I want entry level adequate (sp?) or "good".

Well that's my dime.
Thanks for your time.
Bet you wish I was a mime!!

I looked at the FT11 last week and bought a FT416. Just a little bigger and
GREAT! I was concerned about actually losing the small FT11 and you need a
special (read: expensive) adapter to run it from a car's 12V.

I REALLY like the 416, and it is about $50 cheaper.

Date: 1994-04-23 15:33:16 UTC
From: smithson@ACM.ORG
Message-ID: <2pbf3s$jpn@hopper.acm.org>
Source record: 227117

I just bought a FT416 (_love_ it) and heard about a simple keyboard mod to enable extended receive that includes 119MHz+ AM. The mod was to hold down the up/down arrows while turning the radio on. No go. Anyone know anything about this? Thanks in advance!

1396. hr2600 vs 2510

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-23 16:24:52 UTC
From: jbdaniel@facstaff.wisc.EDU
Message-ID: <199404231624.LAA27781@audumla.students.wisc.edu>
Source record: 227119

Not having a 2600 in front of me, I need help with this one. Is the 2600 the same radio as the 2510 except with more bells/whistles ? If so, do the 2510 mods (extended Rx/Tx, power etc) work for the 2600 ? Would appreciate the enlightenment.

Thanks

The radios are not equal. The 2510 is modifible for CB (note that b/c it is not a type-accepted radio, it would be illegal to transmit in the children's band). The 2600 is not modifible for that. The 2600 has repeater offset and PL which the 2510 does not have. There is a power increase mod available for the 2600 as well.

I think that's it

I also just bought a TS-520S and am looking for a CW filter and the DS-1A 12VDC converter.

BTW, I have a post of TS-520 repair notes from Kenwood.

p.s. I couldn't reply to Bill Fritz's post since it didn't have a return address.

1398. Software for Yaesu FT-1000

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-23 23:50:18 UTC
From: HarrisR@yvax.byu.edu
Message-ID: <HarrisR-230494165018@harris-home.byu.edu>
Source record: 227121

Last month I passed the 5 written exams and 5 WPM. This month I passed 13 WPM and I am patiently waiting for the FCC. I purchased a Yaesu FT-1000 HF transceiver and I am interested in software to control the FT-1000 CAT (computer aided transceiver) system. If anyone out there knows of any software for either PC or MAC I would be interested in getting in touch with you. E-Mail is fine or post response. If there is enough interest I would summarize for this group.

Thanks very much for any help you can give me.

Sorry, it has been a few months since I did my testing. I couldn't do it justice now. Perhaps some digging in the news groups will catch some of my comments of the time. I CAN tell you that the immediate impression is the Timewave was much easier to use and generally better. I had the JPS and the Timewave side by side for a two week test. The delay through the circuit was several times longer in the JPS. There were more "artifacts" in the JPS output. The only place I really found the JPS to do a better job was under very severe conditions when I didn't care how mangled the audio got, I just wanted to hear the signal. I couldn't stand to listen to it fulltime.

Sorry I can't go deeper. It's just been too long.

"J":
The Bendix King LPH 5142 would meet your requirements, it is VERY wideband (144-178) and has the added feature of being type-accepted for use outside the ham bands, since that is it's primary sales area. You would give up some functionality, the display reads only channel numbers, but if this were used frequently by yourself, it shouldn't be a problem. Street price for a new one is about 800 list, but if you check with a communications dealer, they often have used ones with very little use, I got mine for 550 and it had about 12 hours total time.

Check the yellow pages in your area for the Bendix/king dealer in your area, most will deal slightly for cash. Accessories are available and battery life is nothing short of phenomenal, the built in battery saver is very good at extending the life of the battery.

If you buy one, try to get one with the display keyboard included. The keyboardless ones have to be programmed by a computer cable, whereas the keyboard models can be programmed via the keyboard if you know the right tricks.

Source record: 227139

Regarding screen vs. plate modulation, I seem to remember that it's rather difficult to achieve 100% modulation via the screen modulation method, while 100% via plate modulation is a bit easier to achieve. I also remember that screen modulated transmitters ALWAYS sounded a bit thin in the audio when heard on the air.

1407. Re: hr2600 vs 2510

From: lmarrin@news.delphi.com
Message-ID: <2peql2$bcu@news.delphi.com>
Source record: 227131

The Uniden HR-2600 can be expanded in frequency, in at least a couple of ways. The microprocessor can be replaced with an aftermarket CPU with the brand name of "Chipswitch", which I believe sells for around $60. A local ham put one in his radio, and it lowered the bottom of the transmit range to about 25 mhz. Evidently it takes a little more work to get it to transmit on 12 meters.

Also, for those who just gotta have the Chicken Band, a circuit including a second reference crystal and a toggle switch is added. With the switch in one position, it covers 26 to 28mhz, but the display still shows 10 meter digits. (This might lead to some embarrasing screw-ups!) I've heard this mod described, but have never seen it for myself.

As always, it's best to stay legal. Converted ham radios are not legal for transmitting on CB, at least in the US.

Hi everybody,

in relation to the above subject, althought I do not currently own either of the two rigs, I would like to share with you the experience of a couple of friends who have bought the TH-78 about 9 months ago.

The small HT is quite good at the open ground, but watch out when getting indoors. I've personally seen it (on more than one occasions) to get crazy, by receiving noise from the fluorescent lights, in office buildings. It looks as if Kenwood have build a very sensitive receiver, so sensitive that it can listen to any garbage radiation in the area.

1414. New Kenwood 144 MHz & 430 MHz FM/SSB Rigs

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-25 13:59:00 UTC
From: bobw@col.hp.com
Message-ID: <2pgib4$hq0@hp-col.col.hp.com>
Source record: 227137

A careful scan of the May QST reveals that some dealers are
advertising two new rigs from Kenwood.

TM-255A FM/SSB 2 Meter Transceiver 40W $929.95 (AES Price)

TM-455A FM/SSB 70 CM Transceiver 35 W $1079.95 (AES Price)

Both are relatively small, in a mobile radio format but I am not
sure of their exact size. AES has the TM-255A in stock, but not the
TM-455A (still waiting from Kenwood).

Editorial comment: Geez that seems like alota money for single band all mode.

Hi there !
I am an austrian student of computer engineering and I made my license recently.Now I would like to purchase a station, or better a handy. Now, are there any
radio amateurs who would like to contact me and who could help me ? Especially
I am interrested in Packet Radio. So what must a station have to run Packet
Radio with it, are there any good modems and so on ... ?
Please E-Mail me !

If you check out the QST review of the 850 they also noted the xmiter being a bit dirty on SSB at higher power levels. They weren't very impressed with the design of the 12 volt final section. Who knows how much you will actually notice this on the air.

1417. Steinbrecher Radios

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-25 15:21:06 UTC
From: Keith Poole <kp2a+@andrew.cmu.edu>
Message-ID: <QhixzWO00iUz8377AR@andrew.cmu.edu>
Source record: 227142

I just read an article in FORBES ASAP by George Gilder about Steinbrecher radios. In the article he claimed that Steinbrecher had invented a broadband mixer that is almost completely free of spurious signals. This sounds almost too good to be true. Is it? If so, why is the technology not in amateur radio equipment?

Thanks.

Keith Poole

> Anyone know anything about this? Thanks in advance!
>
Way I understand it, if a CPU reset is done by holding the MR and VFO
while turning it on, this will reset the frequencies to 144-148 (also lose
your memories). Then, if you do the arrow keys/power-on, you'll have the
extended RX from 130-174, and TX from 140-150.

Never verified this, as mine had these extended freqs out of the box. If
you do hear about rx down to 119+AM, please share info!!!

1419. loop antenna

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-25 16:04:18 UTC
From: jmg@tntech.edu
Message-ID: <1994Apr25.100418.212@atlas.tntech.edu>
Source record: 227140

I am currently testing the MFJ Super Hi Q loop for an article I am working on. I have been giving some good hard thought as to how to write this one up. I honestly believe in the case of this antenna it isn't quite as simple as comparing it to dipoles or beams. The loop, in my opinion, is a specialized antenna. It is made for people who have limited space or want portability.

If you have the room for wires.. a variation of the G5RV (ZS6???) works great.. with a simple tuner you can work 80-10 and will be pleased with the results. It can be assemble VERY inexpensively, and works great for Field Day and portable operation.

The loop DOES work. I have decided to really check it out by mostly operating QRP with it. The loop works 10-30 meters. I have used it on 15,20,30 so far. This has been due to the band conditions. I have worked both CW and SSB. I have gotten excellent signal reports. The effectiveness of the loop as with all antennas has to do with many variables.. what is near it, what type of ground do you have in your area, is there water nearby, how high up is the antenna, how high up is your QTH and what are the band conditions like.

I currently have 8 transceivers and 4 antennas hooked up for testing.. I can easily switch between combinations for on the air comparissons. I think data on the theoretical gain of an antenna is important.. but there are suffecient variables involved to force you to look at how the antenna will perform for you under your conditions. When I first put up my Gap Vertical I found that on a given day my dipole would beat it out, another day the gap will outperform the dipole. The band of operation, and the distance to the other station are also important.

Getting back to the loop. I brought the loop along on a recent QRP expedition we did. I hoisted it up about 30 feet into a tree and had it set up vertically. Currently I have a short piece of PVC pipe and have the antenna set up horizontally about 1 foot out of my tower up at about 22 feet. I have some real good coax feeding it. I have had very good results with the antenna.

The tuner takes a little getting use to. Another aspect of this antenna is that it is a hi Q antenna. There is definetly less noise on the antenna.. but if you move a little bit on frequency.. you must retune the antenna. If you are going to call CQ this isn't a problem, if you are going to tune around a lot, you MUST take this into consideration. EX: you are on 14.255.. no one there.. you get tired of calling CQ.. you tune to 14.265 and hear a station and want to talk to him.. retune time. While on the same band this is done with a fine tuning button.. and only takes a second or two.. but you will probably have to move slightly off his frequency, hope it is clear and then retune.. and then hope he is still there.

hope this helps

Well, glad someone posted this. I have had my 850S for about 2 years. I have a
Power supply built by a ham in North Tennessee. I think the 850 is one of the
best transceivers on the market. I operate a lot of CW and Pactor.. using FSK.
.the rig excells.. after reading the bad comments about SSB .. I got back on
the air with it on SSB. I consisitently get glowing audio reports. I spent some
time asking for detailed reports recently. Without exception they were all very
postive.

This caused me to ask what the story was with this guy's rig. The 850S is a
contest level rig. There are LOTS of bells and whistles.. that's the good

news.. the bad news is that if you don't set your controls correcty, your audio will be terrible. There is a monitor feature that helps in this respect and the versatility of the digital metering is very useful. .if the rig is working correctly and you set it up .. it will work great.

Also have 2 friends that have the 450s and both love them. .we used the 450 during field day.. worked great.. think it is a BIG improvement over the 440 (our university club has the 440..never really impressed with it).

There is a Noise Reduction setting on the front panel, but I have not
noticed any difference from the SSB setting. The SSB and CW modes work
well, and at 71 dollars ($79.99 less 10% for a preferred customer card)
I think the thing is very good.

It would be nice if it had a decent denoiser (the W9GR denoiser beats it
by quite a bit), but it does a very respectable job as an automatic
notch, and as a variable bandwidth filter on SSB and CW.

1422. Re: Icom 736 Opinions???

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-25 17:27:12 UTC
From: keating@nosc.mil
Message-ID: <1994Apr25.172712.26641@nosc.mil>
Source record: 227056

I looked at an IC-736 at a dealer recently.
It does look like their 737, but I'm told some problems with the 737
were corrected in this rig.

I like the display, and controls better than some radios, but couldn't
buy this radio for my own use because it:
* does not support external 12v power for portable/mobile operations.
* has receiver gaps between some bands

I use a Kenwood TS-690 and Yeasu FT-650 now and like both of these
radios better than this one.

>ouput is 10W. It sounded knd of interesting. I wonder how it compares to the
>MFJ rig.

It's clear, and no secret, that a number of people have experienced and
reported serious problems with Ramsey products.

Given that, and given that this is a much more heavy investment than
the VHF and UHF rigs which are the subject of so much negative comment,
I'd sure wait for an impartial (read "QST") review to pass by before
sending in my deposit.

I'm sure Mr. Ramsey will disagree with my assessment of QST as impartial;
on the other hand, I haven't found either Wayne's World or CQ to really
cut to the chase when the product under review is made by an advertiser.

For its part, I sure hope QST doesn't wait around to review this critter!
It's apt to be both popular, and given past experience, can reasonably be
expected to provide a 'target rich environment.'

I sincerely hope that it's a wonderful, worth-while, high-quality product.
But clearly, some customer caution is the order of the day.

Naturally, one wonders whether producing 10 watts of SSB on 20 Meters is
worth an investment of $350 and the time required a-building, but that's
soley a personal decision.

Greg

From: dgf@netcom.com
Message-ID: <dgfCou1tB.4Lu@netcom.com>
Source record: 227143

In the 2M sprint last week, I toasted the preamp in my RFC 2-317 2M 170W brick. Same modus operandi as last time - hit it with ~50W briefly due to mis-adjusted transverter (normally 30W is max drive) and !poof!, no more RX preamp. The Kantronics/RFC help-line is 100% busy, so can someone who's familiar with the unit or killed one before tell me (1) which transistor(s) should be replaced, and (2) any suggestion as to where I get them?
I'm not too worried about absolute top performance (as in realignment); I just use the preamp to compensate for my brilliant engineering feat of putting the tower 100' from the house (I do have power out at the base of the tower where the brick is installed).

Would appreciate any imformation about the Yaesu FT-11 and/or the Icom dual band IC-W21AT.

Such as: Ease of use.
Is it worth the Cost?
Does the wisper mode work well on the Icom?
Range? (in miles)
Reception?
Ect....

Also, for starting out would it be better to go with a dual band transceiver???

Basically, I'am a novice looking to purchase my first radio and would like to operate on the 2-meter band.

Thank you for your time.

I too ran screen modulation for several years, starting with the old Johnson Challenger on 6M. Of course, that was almost 30 years ago when AM and CW were the only modes on 6, TVI was a serious problem, and sun spots were full up. Things improved dramatically when I combined both plate and screen modulation, even to the extent that I finally ran "super-modulation," a term coined in the late 50s. That translated to 4 6L6GCs with 600v and 250ma on the plates, modulating a pair of 1625s also running at 600V and 300 ma, for 110W RF output. The idea is that you clip the negative peaks at 90 to 99% but let the positive side go as far as it wants, usually about 145%. With these numbers the actual harmonic distortion is only about 7% and the audio boost is 5 dB. When combined with some serious audio processing, using bandpass filtering, compression, asymmetric limiting, and a D104, you too can have a rock-crushing signal on 6M AM for VHF contests.

CAUTION: When incorrectly adjusted, you sound like the rock rather than the crusher. You MUST use both a 'scope and off-air monitoring to get things set up correctly!

>
> Also, because complex waveforms such as the human voice are

That is to say, you want the RF amplifier tube plates (and grids) to be going positive at the same time as the audio modulator plates. You don't want cutoff of the audio modulator going negative to limit the positive-going peaks in the Class C RF power amplifier.

>
> Incidentally, 100% modulation is not only easier to achieve; it is

>

And do you remember all those super-technical guys on SSB who said they could never have a problem with carrier cutoff if their mic audio gain was set too high, because they never had a carrier to start with? They were several times wider than the slightly over-modulated AM signal.

If anyone has MARS (or any other) mods for the heath hw-24-ht
dual handheld could you please e-mail them to me?
The number for heath technical assistance is 616-925-5899,
but all I get is a buisy signal.
Thanks, Dave.

1437. TX coverage for 440MHz band

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-26 15:59:35 UTC
From: mconner@rain.atms.purdue.edu
Message-ID: <CovJ3B.oww@mozo.cc.purdue.edu>
Source record: 227058

I will be buying a dual-band HT in the near future (testing for no-code Tech in a couple weeks) and have been looking at the frequency coverage of the various HTs on the market.

Is there a particular reason why most HTs don't cover the full 420-450MHz? Most of them are 438-450, while some (like the Yaesu) are 430-450. Is most of the activity clustered in the high end of the band, or will I be kicking myself later on if I get a radio that only transmits from 438-450MHz?

I was under the impression that the 2600 included repeater offsets
and PL capability.

Regarding modifying either of the radios, there is a company in California
that offers new chips to allow operation all the way from 12 to 10 meters.

I briefly had a 2510 and the prom that held the code was epoxied in place
to prevent clipping and soldering certain pins that allowed 11 meter operations,
therefore I think that the "non-modifiable" description applied to both radios.

>much you will actually notice this on the air.

That was exactly I was trying to point out. Check this yourself using
a spectrum analyzer. It SSB is in pretty bad shape above 50 watts.
Never said anything about about the audio quality of the 850. It is
very nice. But that does not make the SSB clean, it is wide.......

Anyway someone mention the TS-450. Front end is pretty lousy. Check
out the QST review. If you don't beleive in them (hard to hear
anything against once beloved rig) then do this. If you have couple
of ham operators living near you, ask one to operate at the frequecy
you want to listen at a very low power level (or pick any weak
station) and ask other one to operate may be 5-6 Khz lower or higher
then that and and ask him continously increase the power (if he has an
Alpha, thats even better). See which rig folds first. It will be the
TS-450, not a 440. Crappy blocking dynamic range as I said.

Some of the satellites are FM at 436. You can get them with a ht. I'm kicking myself for buying an FM rig which is only 440-450. Even if you aren't going to work satellites, the extra capability is useful for tuning up antennas etc.
So if it doesn't cost a lot more get the 430-450.

I saw an article some time back about modifing an SWR meter for higher freq. useage. Basically it said to reduce all lead lengths to the minimum, put it good 1n34 diodes, and put in chip caps in place of the ceramic discs. Just dress up the board using high frequency methods.

I have been meaning to try this myself . . .

Have fun, Tracy

1447. WANTED: Manual for Standard C500 (UKW/UHF) Mobile

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-27 11:41:10 UTC
From: christcl@cui.unige.ch
Message-ID: <1994Apr27.114110.15390@news.unige.ch>
Source record: 227069

Hello world,
I have an RX/TX Mobile 145/440 "Standard C500" and I have just the manual
in german (quite hard for me to understand technical german) and in
japanese too (impossible for me to understand).
So as I said it's a bit hard to understand all for me, and now it's
blocked in 2 ways ; - The 'Call Button' don't `beep` anymore
- when I use the 'rpt' function (to RX in a freq
and to TX in the freq -0.60 Mhz) it make a loud
noise and I can't talk, and nobody can hear
something else than this ununderstandable noise.

I tried to reset all, to force it to 'forget all' But that did not worked.
So I don't know how to get it back OK ...

So I am seeking for manuals for this "Standard C500" in French or in English.

If someone knows where I can find those, or where I can find some help ...

Email me at christcl@cui.unige.ch

Thanks, you all to read me and to answer ...

The only thing you have to do to receive 800MHz is hold down the MHZ button
while the UHF band is selected. There is a mod to add a cap that improves
sensitivity. I know the limits go through the cellular band, but I don't
remember how high.

Some questions have been answered, but let me make another comment.
Specifically, if you are planning on operating outside of the USA,
the extended frequency range on an HT - specifically 430-450MHz is
ESSENTIAL. For many years I lived in Japan (as 7J1ABV) - there, the
70cm band in its entirety is only 430-440 MHz. Most of the packet
operation is closer to 430 with FM and SSB up at the higher ranges
(generally speaking). These days, virtually all Japanese-made
HTs for USE IN JAPAN come with the so-called "J" mark - meaning that
they CANNOT be modified for extended frequency use (i.e. 440-450).
For someone like me, the Yaesu FT-470 and/or FT-530 are IDEAL - if
for no other reason than they are "export" machines and are capable
of the fully 430-450MHz usage. Unfortunately, I've got an old
Standard 430-439 HT which is virtually useless for me here in the USA
now.....nertz.

Cheers & 73 de Sandy

For Sale Heath ETW-3400- Assembled microprocessor trainer
and EE-3401-A Complete training course.

This is in new condition.. most of course and manuals, and
tapes and parts still in original packages.

This is "The World's Most Popular Microprocessor Trainer"
used by many universities and is described in Heath's
current catalogs.

The ETW-3400-A sells for $499.95
The EE-3401-A course for $149.95

Total = $649.90

I will sell this for $150 + shipping.

Jeff

The best way is to by an amplifier that is designed for low input power 1 to 5 watts and gives the desired output. Tweeking your handheld for higher power will not really gain you that much ie 3 watts to 5 watts is only about 2.2 dB gain, you can do that with a good antenna and your talk time will be reduced.

Hi. I'm looking for the exact same thing, so I thought I'd share my
progress so far.

Something I just learned recently is that the standard (voice) WWV on
5MHz, 10, etc has the timecode in it as a 100Hz audio signal. I tried
building a 100Hz detector (based on a 567/NTE832), but my shortwave
reception wasn't good enough for it to work, especially while the
computer was on.

Also, they send out just the raw pulsed carrier (same data) on 60KHz.
That seems to be the one most auto-clocks are using. I'd imagine you
could build a custom antenna to pick up 60KHz, but I'm just starting
to learn about this stuff..

I have the specs from NIST on the data format and timing, and it looks
very useful. I'd love a box that picks this up and feeds it into a
port.

I've found some Sun code for decoding a "stratum 1 CHU" signal, but I
don't know what that is or how to receive it. It describes a circuit
for detecting the tone using a 300baud FSK modem chip. I can send you
the file if you're interested.

Oh, in another file I also found a reference to a "Spectracom Model
8170 WWVB" clock with RS232 output. I can't find the company anywhere
or any more info on it. I did find a company called Spectracom in
Canada, but they are wicker chair importers, according to their
receptionist. :-)

Happy Hacking!

1457. Help with ATV antenna tuning, UHF SWR meter advice, general ATV stuff?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-28 07:03:21 UTC
From: jefman@utcc.utoronto.ca
Message-ID: <jefman-270494230322@pme15.pomo.wis.net>

Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Hi, I'm having some difficulty working with my ATV setup. I've got the AEA VSB70, and I've built the 8-element quagi antenna from the ARRL book. I don't seem to be getting the kind of performance I think I should, it's pretty fuzzy at only three miles away with a direct line of sight. I need some advice on how to go about tuning the antenna. What kind of test equipment do people use? I've gone to both my local ham stores and they've told me they don't have any SWR meters that will work up to 500MHz with under one watt of power. With no SWR or power meter, it's pretty hard to tune the antenna. Are there any other methods? Can anyone recommend a good SWR meter? Or should I give up on making my own antenna and just buy one (what the ham store recommended)? Anyone else with experience using the 8-element quagi for ATV? What kind of performance should I expect if it's working properly?

Also, I'm thinking about getting an amp; probably the SAU-4 brick. Does anyone have plans for putting an amp together with this module? Or any recommendations for a better solution?

Finally, are there any ATV resources on the Internet, eg. mailing list, ftp site, etc.?

Thanks in advance... <Jeff ve3 kyh

1458. Re: NEED INFO ON TM732A

Newsgroup: rec.radio.amateur.equipment

Source record: 227079

After a long decision process, I finally bought a 732A for my car.
I had some hesitation since I had previously bought a th78a (HT) and was
very unhappy with the intermod, (on 2 mtrs) which was so bad that the
HT could not be used mobile, resulting in a separate mobile purchase.
The 732 is basically a good radio but incredibly, has a bad intermod problem
on 440MHZ (the opposite from the th78a) which is starting to annoy me.
The 440 receiver is easily overloaded, making the cross band repeat performance
quite bad. Also I found an annoying clicking on the 2 mtr band whenever you
are scanning and also monitioring a station on 440. It was bad enough that
I brought it back to the store where we found out that they all do this.
Also, I found out that the remote mount cables are not available. I had to
cut and make my own. The rig has dual ant. cables, resulting in the need
to purchase either 2 antennas or a duplexer.
I have good reports on my audio, and the control functions are acceptable.
I also noticed that a new model has just been announced that replaces it.
Summary: If I were to do it again, I would buy the standard dual band.
(You get what you pay for)
My own opinion, not my employeers.

Seems like this could be used to drive a transverter. It would
be nice to have more than 2mhz of the band to transmit with in this case.
Can the HTX-100 be modified to do this?

Radios such as the Yaesu ft-5100 and Kenwood tm-732 boast of dual in-band receive. Does this mean that I can program the memory bank for the UHF side to hold VHF and UHF frequencies? I would like to have a rig that I can have the VHF half scan the local repeater frequencies (mostly 2M) while the UHF half scans public service VHF/UHF frequencies. Do either of these radios allow you to program VHF frequencies on the UHF side memories or is the dual-watch feature for the VFO only? Thanks...

I have recently passed my amateur radio Tech Licence exam and I will need to sell my R1 (which I dearly love) in order to buy a dual band tranceiver. Can't understand it, my wife just won't let me tie up more than a thousand dollars in radio equipment :-).

The R1 is virtually new. Purchased from Grove last Christmas for $459. It is still under manufacturers warrantee and includes a spare registration card to register the new owner. Internal batteries have had about 6 charge cycles on them. The unit is in perfect condition and includes the following accessories:
Standard:
Handstrap
Antenna (FA-4B)
Wall charger
Belt clip
Extras included:
BP-90 battery pack w/ 6 AA replaceable Ni-Cads (retail $19 + bat cost),
Protective Leather case fitted to R1 with BP-90 attached (retail $19).

I won't bore anyone with a listing of the R1's extensive array features, but anyone with questions is welcome to contact me. I'm sure everyone knows the R1 receives cellular with no modification needed.

TERMS:
Price for the whole package: $ 445 + shipping, COD-Cash, I will pay shipping insurance.

CONTACT:
Steve Willingham, E-Mail: swilling@harris.com or swilling@ic1d.harris.com
Voice phone: (407) 729-7204, (If I'm not in, leave message, I'll call back)

Hi Jeff,
I've been using quagis on ATV and other stuff for several years now with
good results. I suspect that the bandwidth of a quagi, though better than
a straight yagi, is still a bit narrow for a full atv signal, but it
seems to
work. I get a low swr for about 3-4 mhz bandwidth typically.

I've typically cut mine for the video carrier frequency or a little
higher,
tuned them using a radio shack VHF/UHF wattmeter/SWR bridge and my ht
and then tweaked them with the video signal. The RS meter has a 15 and 60
watt scales, isn't terribly accurate, but it can tell you when you are
reducing
the reflected power and give you a feeling for how good or bad the
antenna is.
Do I trust the SWR measurement, not a bit. But that doesn't mean it isn't
useful.
(cheap too, $30 currently) I usually use my HT to take swr measurements at
1 mhz intervals and trim the driven element and if necessary the
reflector to
get the response I want. SWR with the video signal will be higher than
with a
carrier because parts of the signal (sound carrier, etc) will be up the
swr curve
a bit and you have a lower sideband (well,you don't) that is out of the
passband of
the beam. Haven't toasted any finals yet with this rough and ready

method.

I took the data in the handbook for the 440 and 432 quagis, developed a simple
pascal program to interpolate them to get data for other frequencies, and use
that to calculate antennas for need (421 for repeater reception, 439 for the
input or simplex, 435 for Oscar work, etc)

Currently we are using a home brewed quagi (built on a 2x4 boom - usually I use
a 1x2) for our ATV repeaters transmit antenna. I use a couple for field shots, other
stations in the area use them for both transmitting and receiving. So they do work.
Ranges are in the 10-20 mile range for P4-P5 from the repeater running 10 watts
at good elevation. Talking back to the repeater range with a watt runs in the 5 mile
plus range with good results. Sounds like there is something awry in your system at
one end or another - or it could just be terrain.

Be interested in hearing about your experiences - here or email.

73 de Kevin, WB2EMS

I think what you are looking for if greater Effective Radiated Power.
IMHO, getting a better antenna first is much more important than
installing that planet killing linear amplifier.

Your rubber duckie is probably on the order of -10/-6 db from a 1/4 wave
vertical and a 5/8ths wave is 3db above that. Getting the RF outside the
car or house into a 5/8ths wave should give you at least 10x the ERP.

I have a $25 1/4 wave on the roof of my car and can hit repeaters > 50 mi
away with only 7w from my HT. You can go with a 5/8ths dualbander for
less than $60 and sound much better than putting $350 into a VHF amp.
Then again, you can get the antenna AND the amp...

The FT-5100 will not let you bank both VHF and UHF freqs in the same
bank. The way the 5100 handles dual in-band receive is by putting two 2m
banks on the same display (pressing "band" in this mode will switch both
banks to 440).

The 5100 also does not RX in the UHF public-service band without a
hardware modification (darn it)!

Hi:

I'm new to this group and ham radio, (I do not have a ham license yet). To start with I picked up a Radio Shack HTX 202 2 meter, but I would also like to look into 440 MHz. I thinking of picking up the Radio Shack 440 while it's on sale, but would appreciate any info or advice on other equip. Would this 440 be a good starter rig or should I pass and save up for something like a Kenwood dual band TH 78A or equiv.

My plan is to start with the no code Tech class and see what happens from there.
BTW, I ordered the King Ham radio no code Tech video to study for the license. I liked their Private and Instrument Pilot videos and thought I'd give these a shot.

Any feedback on the 440 radio would be appreciated.

Thanks

Ken

Can't speak for the TM732, but I've had a ft5100 for about a month now (love it!)..

Memories are arranged in 2 banks for each side, each bank containing 20 memories, for a total of 40 VHF and 40 UHF. This layout makes it possible to scan 2 seperate banks in one band. Very handy if you monitor 1 favorite repeater continously, but want to scan other repeaters in the same band. And having 2 banks per band is great if you regularly drive between 2 cities.

A scan will only go through one bank (20 memories). Very very fast scan rate. Push 2 buttons to go to the other bank in the same band. Of course, both VHF and UHF can be scanned simultaneously, but it is scanning 1 bank on each band.

Each bank has 2 upper and lower programable memories for band scanning (versus memory scannng). It also has 'Priority monitoring'...when enabled, will check your favorite frequency every 5 seconds for activity. And another feature is 'Call frequency'...programable frequencies you can access by a button. Then theres 'Alternating band memory scan'....This will scan 1 bank in each band by swapping the bands continously between main and sub-band positions.

All rather confusing...and takes a while to figure out (let alone program!). The simple answer to your question is no..you can't store VHF in UHF banks or vice/versa. But with 4 banks, priority monitoring, 90 some memories, and alternate band scan you have lots of options and different ways to accomplish what your're looking for.

G'day, I wonder if anyone can give me some comments on the Cushcraft R7...incidentally, just for interest, it costs A$937 in VK
, hefty to say the least. My QTH is abt 500m above sea level and I get out pretty well on everything other than the R7. SWR is
good across the all bands - but, for my money it's almost totally deaf. The lower counterpoise radials only sit about a metre a
way from a steel deck roof but I don't think this should affect the performance. The rotten thing broke where the base insulato
r fits into the base tube (held with epoxy glue and one rivet) but has been replaced with their "fix". It's still almost totall
y deaf...anyone care to comment?

1477. Batteries for Kenwood TH-78A

Newsgroup: rec.radio.amateur.equipment
Date: 1994-04-30 04:32:22 UTC
From: mrw13@namaste.cc.columbia.edu
Message-ID: <2psn0m$h5n@apakabar.cc.columbia.edu>
Source record: 227003
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

I finally decided on buying a Kenwood TH-78A and am now considering which batteries to get with it. There are actually a couple mail order places which will ship the radio with a battery besides the standard PB-13. This is how the three main Kenwood batteries compare:
PB-13 Standard 7.2V 700A 2.5W on High Power (approx. 4.5 hrs.)
PB-17 High-Power 12.0V 700A 5.0W on High Power (approx. 3.0 hrs.)
PB-18 Long-Life 7.2V 1100A 2.5W on High Power (approx. 7.0 hrs.)

There is also the BT-8 battery case which takes 6 AA batteries; what kind of output (in watts) does this provide for and how long will it last?

Additionaly, how about batteries that fit the Kenwood but are made by other manufacturers? I'm specifically looking for a "long-life, high-power" battery. Any suggestions/recommendations out there? Thanks very much.

I guess I should be a little more detailed in what I am looking for.
Specifically, I want the "bullet" type of microphones by Astatic, Shure,
etc. To be used for playing amplified harmonica. I am told that these
type of microphones were popular desk microphones for ham radio use for
quite awhile.

Sorry about the double post- I'm kind of new at this internet thing

Thanks again

John

Hi,
I just purchased a Johnson Transcom II which I want to convert to packet. It was a top of the line unit in its day - 30-40 watt two meter unit built very well. It was ment to compete in the 70's with Motorola better mobile units.
If anyone has any info on the above please let me know. Also I used to be on a mailing list which I believe was land-mobile. This list was for generally used by commercial service personel. I have since had my name taken off the list and also deleted how to get on the list. If anyone knows how to get put on the server for this list please forward that info to me.
Thanks

swilling@harris.com writes:
>The R1 is virtually new. Purchased from Grove last Christmas for $459.

**After checking my records, I realized I only payed $449 for the basic
unit, not $459 as previously stated. So I've adjusted my asking price
accordingly:

I have recently passed my amateur radio Tech Licence exam and I will need
to sell my R1 (which I dearly love) in order to buy a dual band
tranceiver. Can't understand it, my wife just won't let me tie up more
than a thousand dollars in radio equipment :-).

The R1 is virtually new. Purchased from Grove last Christmas for $449.
It is still under manufacturers warrantee and includes a spare
registration card to register the new owner. Internal batteries have had
about 6 charge cycles on them. The unit is in perfect condition with the
original box and includes the following accessories:
Standard:
Handstrap
Antenna (FA-4B)
Wall charger
Belt clip
Extras included:
BP-90 battery pack w/ 6 AA replaceable Ni-Cads (retail $19 + bat cost),
Protective Leather case fitted to R1 with BP-90 attached (retail $19).

I won't waste time listing the R1's extensive array features, but anyone
with questions is welcome to contact me. I'm sure everyone knows the R1
receives cellular with no modification needed.

TERMS: Price for the whole package: $ 435 + shipping, COD-Cash,
I will pay shipping insurance.

Thanks, and sorry for the original price error...

Don't bother. It would be less expensive to buy a commercial-
built 6 M or 15M rig. You would end up "building a new rig" anyway.
That rig was built so tight (FCC type acceptance to prevent modifications
for 11M) that is would not be practical to modify it for any other bands.
There are some mods to make it receive out of band, but I don't think you
can make it transmit out of band.

No need to remove it. Unlike some (most?) this HT does NOT charge the nicad pack when dc power is applied to the ext dc jack. Just remember to turn off the HT as well as the pwr supply when finished or the HT will remain on using the nicads.

1501. YAESU FT-530 trouble...

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-02 18:19:11 UTC
From: hemstree@cs.colostate.edu
Message-ID: <HEMSTREE.94May2121911@handel.cs.colostate.edu>
Source record: 227026

I have a friend who recently purchased an FT-530. He loves it except
for the inevitable one thing...

The signal is squelched/muted when receiving a signal transmitted by
an AZDEN PCS-4000 on 2m. This happens about 1 out of 5 transmits.
The AZDEN is transmitting 5w from 50ft. to several miles away. The
AZDEN does not have PL and the FT-530 did not have the Tone Squelch
enabled. He took it to HRO and asked to exchange it with another one
which had the identical problem. Other radios will not enable this
problem. The problem is not reproducible on 70cm's.

Has anyone had similar problems with the FT-530?

Thanks for any advice/comments,
Charles

1502. Yaesu FT-41R PL problem--read before buying (FT530 note at end)(LONG)

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-02 18:48:07 UTC
From: kennish@kabuki.EECS.Berkeley.EDU
Message-ID: <2q3ht7$nen@agate.berkeley.edu>
Source record: 227027
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

This note is being provided as a service to the amateur
community. It is not intended to endorse or dis-endorse
this product, but rather to educate the community to a
problem, for which a solution exists.

****

The Yaesu FT-41R (and perhaps it's sister 11R) has a problem
with the PL (CTCSS for you Motorola lawyers) tone frequencies.
If you do NOT buy the optional FTS-26 CTCSS DEcode (tone
squelch) board, the PL tone is generated by the microprocessor
itself, rather than a dedicated PL tone chip (MX265). As a
result, the PL tone generated can be slightly off, to a
degree to make certain reed-type decoders used on some repeaters
go nuts. This makes repeater use difficult, if not impossible. If you do
go out and buy the optional FTS-26 board, the tones are
generated by the board, and this should not be a problem.

It turns out that the PL tone is too high in pitch, and this difference
is audible at the 250.3 PL. Yaesu's fix, according to
Yaesu Tech Bulletin 9420 is to increase the size of the
capacitor on the microprocessor crystal to pull the frequency
down, thereby lowering the PL. The mod specifically calls for
C2018 to be changed from 33 pF to 39 pF.

I have not done this yet, as I am awaiting the part from Yaesu.
This mod is built into the factory beginning with lot #12.
Units prior to this will need to be mod'ed or you may just
be lucky. To determine your lot number, look at your serial
number. the lot number is the two digits immediately following
the letter. (i.e. a S/N of 3M078626 would indicate a lot #07)

If you are contemplating buying a unit at a retailer, check the
serial number -- if it is prior to lot #12, test the unit on
a few repeaters and see if your voice drops in and out.
Newer repaters with electronic decode tend not to be as sensitive
to PL frequency mismatch as are old mechanical reed style decoders.

****

Also, to FT-530 owners:

There is an existing INTERMOD fix for the 530. Now, before you
all go and jump to put your units in the mail, let me tell you
what this mod does.

The mod entails changing the first IF frequency of both receivers.
The VHF frequency moves from 15.25 to 17.25 MHz, and the UHF
frequency moves from 47.225 to 44.775 MHz.

What this buys you:

If your INTERMOD problem results from two strong signals that
are mixing in the front end to produce a signal at the frequency
you are trying to receive, this mod will do NOTHING for you.
(e.g. you are listening to 446.00 MHz, and two signals at 452.00
and 458.00 MHz mix to produce a tone at 446.00 MHz, then you are
out of luck).

However, if the problem results from two strong signal
that are mixing to produce the IF frequency, then this may help.

Alternatively, if the problem is really IMAGE response
(you are picking up a station that is 2xIF away from your desired
station), then this MOD will help.

Think carefully and investigate thoroughly what your problem really
is before you send the unit in. The mod does nothing to affect
receive range, nor does it do anything to change RF desense,
overload or other nastiness, just changes the image response
frequency...

A hint in diagnosing your problem... The first IF frequency is
not dependent on the frequency tuned, but rather which receiver is
used. The left receiver uses the VHF IF, while the right receiver uses
the UHF IF. Tuning a UHF frequency in the VHF side uses the VHF IF,
and vice versa.

****

Sorry this post got so long, but info is info.

-Ken

Hello,

I have the following 220MHz gear for sale. Everything is barely used,
and like new. I just don't have time for 220MHz...

1) 220MHz module for the Yeasu FT-736R $225 obo
2) Diamond F-142A 220MHz Base Station Antenna $75 obo
3) 220MHz Cushcraft 7 element yagi $50 obo
-> or above 3 items for $300

4) 220MHz module for the Kenwood TM-742A or TM-741A $225 obo
5) Larsen 220MHz Mag mount whip w/ 15ft coax $25 obo
-> or above 2 items for $225

Or all of the above for $500

Please send email if interested.

If you mean the FT-411, I have the mods for it. I can't recall seeing an
FT-416 before, so pardon me if it does exist.

If a book covers broadcast AM through UHF, it _is_ a wide range of
frequencies: ~500KHz to 3GHz. :-)

I like _Solid State Design for the Radio Amateur_, by Hayward and DeMaw.
It is written more for hams than EEs, but there is a lot of meat to it.
(An EE won't be disappointed.) It focuses on techniques effective from
MF to VHF.

For a broad introduction, read the RF and transmission line sections of
The Art of Electronics, by Horowitz and Hill. They don't provide enough
info to permit designing a radio, but they cover the big picture well.

> Also, does anyone know of any single chip RF trans and receiver packages?

There are lots. Try the Motorola and Nat Semi linear databooks. You
might also try Signetics. They have neat stuff, but I don't know if
they have single-chip transmitters or receivers.

What you must decide first is what band you will be using. There are
lots of chips, but they won't do you any good unless you know which
frequency and modulation method are permissible.

Do you prefer the Heil 4 or 5 element?

My primary interest in using a mike at all is HF contesting. I would assume that the 4 would be the ticket, but I have heard the 5 recommended too.

Rig in use at moment is TS940.

Thanks for your help.

Bob

For contesting (and running barefoot in general), I prefer the Heil 4
element. It just seems to give my signal a bit more punch, even
without the compressor on.

I use mine with my Icom 737, which needs a pre-amp to get the Heil up
to a decent signal level. Check to see if your rig needs one if you
go with a Heil.

> What pin/color wire arrangement did you use?

Use the information in the PK232 manual for the Kenwood TS-430/440 through the 13-pin accessory connector. this is the most reliable point of connection.

>
> The pk232 is receiving data ok and displaying but when I transmit it

> ie I can't hear anything but a carrier on a separate receiver.
>

First, the rig must be in FSK, USB, or LSB depending on your preference (FSK uses the CW filter on LSB). Now watch for RF output power on the meter (ALWAYS do your testing into a dummy load, not an antenna!). If you are indeed on the air you will see it there. You can adjust the power output level by changing the mic gain; don't try for more than about 40 watts and NEVER drive it so hard that the meter indicates any ALC action.

You did not mention whether you are going in through the mic jack or the accessory connector on the rear panel. The gain of the transmit audio stage is much less when using the rear acc connector, while the output is a fixed level regardless of AF Gain control setting. Also the front microphone line can be MUTED when you transmit through the rear connector on a TS440. Mine requires the Mic Gain control to be advanced from 9 o'clock to 1 o'clock to get 40 watts output, using the absolute maximum audio out from the PK232 and cutting out its 680 ohm resistor. Hopefully Kenwood fixed the low gain problem of my TS 440 when they re-designed it into the TS450.

1519. Prolem w/TS850 ant tuner

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-03 13:12:06 UTC
From: rogjd@netcom.com
Message-ID: <rogjdCp8A06.FH6@netcom.com>
Source record: 227044

My TS850S/AT, which has worked flawlessly for several years (I bought one of the first ones sold in Southern California) has developed a problem with the antenna tuner: Even when tuning the rig to an antenna with a very low SWR, it periodically will get "stuck" tuning it, at around 1.5 to 1 or so. The motor chugs and chugs, but appears unable to "seek" to the 1.0 spot. Sometimes if I switch bands, the problem will disappear, but will reappear later.

Any ideas what might be causing this sort of problem?

I believe I *have* seen a mod for extended RX posted.
It goes like this . . .

(1) Sell HTX-202
(2) Buy ICOM something-or-other

You now have extended RX on your unit.

:-) (and my apologies for forgetting the name of the original poster.)

>
>Thanks & 73 -- John, W3GOI

John,
1 - No, you don't have to take the NICAD pack off if you plug your
12 volts into the jack in the top of the rig. DON'T PLUG IT INTO
THE BATTERY! YOUR BATTERY WILL GO BOOM!
Hint for free: Spend the few dollars and buy the line noise
filter for your car. It will help keep the alternator whine
from week signals.
2 - The factory setting is fine for the SAVE function. I don't know
that there is really any difference other than the down time.
I have experimented with mine with different settings. They
all run the battery down at about the same rate, about 18 to
20 hours (squelched, no audio.)

I did not get a single responds on this. I know that there are mods for FT415 and FT411. FT416 is the new model and it is slightly different from FT415. Does anyone have the mods for this model? This is the 2m HT.

True, but my Argonaut was $329, new, and produces about the same thing on
5 bands. As for what it's worth now... ...well, less than $350, I'd expect.

The FT-416 is a mostly a repackaging of the FT-415's guts. If you're
worried, call Yaesu or send them a copy of your license for the
modification info (note that you'll lose some features [ARS?] of
the FT-416 if you do the complete mod).

1534. Idea, 10-10 members....

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-03 19:10:20 UTC
From: wb9omc@constellation.ecn.purdue.edu
Message-ID: <wb9omc.767992220@constellation.ecn.purdue.edu>
Source record: 226958
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.policy,rec.radi.amateur.space

I'd like to gauge the interest among members of 10-10 International who
are on the Internet for a group, possibly called:

rec.radio.amateur.1010

The purpose of the group would be multiple:

1) to help disseminate information of general interest to 10-10 members
who have access to Internet.

2) to help 10-10 members set up skeds, nets and other communications events.

3) to help develop interest in not only 10-10 International but to maintain
interest in 10 meters in *spite* of the current lull in the band.

4) to help develop computer operating aids for 10-10 contests and
paperchasing.

5) to serve as one focal point for 10-10 members to discuss the organization,
contest rules, awards rules, etc.

6) other future purposes realted to Amateur Radio and 10-10.

****

I think that emailing me would probably be preferred to clogging up
a number of newsgroups with "me too!" kinds of mail.

If you are interested or have a *brief* thought on the subject, please
email:

wb9omc@harbor.ecn.purdue.edu

flames and/or mail bombs will be ignored, deleted, /dev/null'ed, etc. :-)

If interest seems positive enough, I will make some contacts with the
officers of 10-10 to find out in what ways, if at all, they would
like to make contact and maintain contact with such a newsgroup.

>has worked for you. Luckily, there is no tint under the mount. Thanks...

The Larsen Glass-Mount directions say to use a razor blade and peel the mounts off that way. Then clean the glass with a solvent to get the old glue off. They sell a remount kit (around $7.00) for their antenna. I don't know if their kit will work with another antenna or not.

>that the 4 would be the ticket, but I have heard the 5 recommended too.

I have three Heil headsets. Two of the open-air style jobs, one with the
#4 and one with the #5. I also have the newer closed-style headset with
the #5 element. I think overall, I like the #5, even for contesting.
I typically run about 10 dB of compression, and it seems that with
the compression on, that the wider frequency response element is more
noticible in a pileup. Maybe it lacks the (industry buzzword follows)
"punch" that the DX element has, but from what I hear listening to myself
on the monitor and on the DVR, I like the #5 better. Rig on this end is
also a TS-940.

From: Robert Schnick <qrp@delphi.com>
Message-ID: <Rm9u0e9.qrp@delphi.com>
Source record: 226965

Smiley HT 5/8 wave antennas are superb and reasonable. I use them on all my HTs. Unfortuneately they don't make a dual band antenna for y'all with dual banders. The 2 meter antenna is about 14 inches long and (dare I say?) exhibits gain over the factory-issued ducky.

Thus spoke srs3@crux3.cit.cornell.edu (Motti):
>I am assembling a list of mail-order addresses and phone numbers
>of places that sell radio and electronic equipment, as well as
>consumer electronics. Any info would be greatly appreciated.

Greetings. Such a list already exists (and has existed for
a few years). It is maintained by John Woods. I include
the latest (?) version below:

----------chop-with-axe----------chop-with-axe----------
From: jfw@ksr.com (John F. Woods)
Subject: My List of Mail Order Electronics Companies
Date: 25 Feb 94 16:44:07 GMT

A real prompt update for once; check the end for the changes (as usual).

[$Revision: 2.16 $; last updated Feb 25, 1994]

Here is my list of companies which will sell electronic components in
small quantities. Most of these places I have bought from, a couple
I haven't. Being a ham radio operator, I am most interested in
RF components, and in particular, air variable capacitors, which tend to be
scarce (and tend to be used or surplus even if I've otherwise labelled the
seller as "NEW"). I apologize in advance for disparaging remarks about
what happens when parts suppliers start selling computers, but anyone who
has watched Jameco over the years will know just what I mean (though
their latest catalog hints at possibly returning to selling parts).

Categories are:
NEW COMPONENTS Distributors and sellers of new components, or "new and some
used" in a couple of cases.
SURPLUS ELECTRONICS Usually overstocks, occasionally used equipment.
Ideal for stocking the junkbox, usually have dependable stock lines
of resistors, capacitors, and some semiconductors, but won't have
those LCD modules forever... An invaluable resource, don't shy away
from them.
SPECIALTY COMPONENTS In particular, crystals and toroidal cores.
KITS Ham radio kits, random electronic kits, whatever they have.
LITTLE GUYS Separated out because of some twisted sentimentality,
I suppose. Intended to honor one or two ham spare-bedroom
operations. Note that sending $1 along with catalog requests
is a big help for these folks.
PUBLICATIONS Two publications which are essentially all want-ads, plus
the address for SAMS PHOTOFACTS because everyone always asks about
it on sci.electronics.

Note on shipping costs: I don't always update these frequently enough, and they're generally for continental US unless otherwise mentioned.

NEW COMPONENTS:

Ocean State Electronics
P.O. Box 1458
Westerly RI 02891
+1-800-866-6626 (orders)
+1-401-596-3080
+1-401-596-3590 (FAX)
Minimum $5, S&H $4, free catalog. Wide array of RF parts, especially air variables and B&W coils.

Radiokit (store is located at:)
P.O.Box 973 169 Jeremy Hill Rd.
Pelham NH 03076 Pelham NH 03076
+1-603-635-2235
+1-603-635-2943 (FAX)
No minimum ($3 service charge if under $20), many kits, lots of J. W. Miller chokes & coils, B&W coils, RF switches, Millen variable capacitors, lots of parts in general. As of 24-Feb-94, they are again STILL out of catalogs, and just barely might have one by Dayton this year. They do accept mail orders, but you'll have to call for prices and availability. A classified ad in 3/94 QST says "Call/SASE", I guess they may have fliers.

Circuit Specialists Inc
P. O. Box 3047
Scottsdale AZ 85271-3047
+1-800-528-1417
No minimum with check or money order, $15 otherwise. $3 S&H.
New electronics, good RF assortment, increasing infestation of computers.

Mouser Electronics Mouser Electronics Mouser Electronics
11433 Woodside Ave. 2401 Highway 287 North 12 Emery Ave.
Santee CA 92071 Mansfield TX 76063 Randolf NJ 07869
Mouser Electronics
370 Tomkins Court
Gilroy CA 95020
Catalog Subscriptions: (800) 992-9943 (Continental US only)
Sales & Service: (800) 34-MOUSER (800-346-6873) (US, Puerto R., Canada)
Very complete catalog of brand-new components (though no air variables). Usually quick service, $20 "minimum" ($5 charge under $20). When ordering, you may want to be sure to ask about availability and shipping locations; they have several warehouses, and frequently orders will get sent from several warehouses (which drives up the shipping costs). Export orders have a $100 minimum, except for Canada and Mexico.

Digi-Key
701 Brooks Ave. South
P.O.Box 677
Thief River Falls, MN 56701-0677
+1-800-DIGI-KEY (334-4539)

+1-218-681-3380 (FAX)
No minimum, $5 handling under $25, free and very complete catalog, very nice indeed. Prices aren't always the best, but rarely excessive. Weak on RF specialty parts (though they now have the ever-popular NE602N), but they do have blue LEDs.

Active Electronics
11 Cummings Park 237 Hymus Blvd
Woburn MA 01801 Pointe Claire, Quebec, H9R 5C7
+1-800-677-8899 (Main number for US and Canada)
+1-514-630-7410 (International)
+1-514-697-8112 (FAX)
$25 minimum, $5 S&H UPS, catalog has a "$10 Suggested retail price" but they sent mine for free. They have 8 stores in the US (Santa Clara CA; Chicago IL; Baltimore MD; Woburn MA; Detroit MI; Mt. Laurel NJ; Long Island NY; Seattle WA) and 10 stores in Canada (Quebec City; Montreal (2); Ottawa; Mississuaga; Winnipeg; Calgary; Toronto; Edmonton; Vancouver BC). Each store has its own 800 number and FAX number, call the main number(s). International orders are to be mailed to the Canadian address, but they want payment in US funds! Lots of stuff, oriented more toward supplying last-minute requirements of companies than hobbyists, but perfectly happy to take your money in small doses (stores have no minimum order). The $25 minimum for certain items is no longer explicit, but they note that some items will "ship in factory minimum package quantities", which might be worse.

Maplin Electronics Ltd.,
P.O. Box 3,
Rayleigh,
Essex,
SS6 8LR
U.K.
Phone numbers: your international code +44 702 554161 for sales
+44 702 553935 Fax
+44 702 556001 Tech enquiries(2-4pmGMT)
"Over here [in the United Kingdom] the main hobbyist electronics supplier is Maplin Electronics who stock a wide variety of equipment. They have a catalogue which can be shipped for 10.65 pounds sterling by air or 5.50 pounds sterling by surface mail. They accept Mastercard, American Express and International Reply Coupons. They have at least one type of air-filled variable capacitor!" (Thanks to Kev White at Cambridge University).

Newark Electronics
Send catalog requests to:
Newark Electronics
ATTENTION CATALOG DEPARTMENT
4801 N. Ravenswood Ave.
Chicago IL 60640-4496
+1-312-784-5100
They don't have a single mail address or phone; instead, one is supposed to call the closest of three pages worth of branch offices. I don't feel like typing in the entire list (it's copyrighted, anyway :-), so send email

for your "local" distributor, or call their administrative offices at the number above. They have a $25 minimum order; they are a Real Distributor, but accept small orders (over the minimum, of course). Their catalog currently 1248 pages; they are very complete (except, of course, for my favorite scarce item, the air-variable capacitor). Note that the catalog prices tend not to match reality all that often, so order by phone rather than by mail; prices tend to be higher than other places, but they have a lot of things that are hard to find from other outlets. Also note that they have six Canadian offices, and one UK office, and will take international orders at 500 N. Pulaski St., Chicago IL 60624-1019, +1-312-784-5100 (FAX +1-312-638-7652, TLX 6718690 NEWARK U).

Arrow Electronics, Inc. Catalog requests to:
Catalog Division Catalog Division
1860 Smithtown Ave. 25 Hub Drive
Ronkonkoma NY 11779 Melville NY 11747-9828
+1-800-93-ARROW
Minimum $25; they no longer have a catalog. They are a Real Distributor, but also didn't mind my placing a personal order (a couple of years ago).

MCM Electronics
650 Congress Park Drive
Centerville OH 45459-4072
+1-800-543-4330
+1-800-824-TECH (product questions)
+1-513-434-6959 (FAX)
Minimum $20 ($25 for charge cards, and they don't take personal checks), handling $1.95 + shipping. Oriented toward repair technicians, really heavy on VCR parts and somewhat overpriced doodads, lots of useful stuff not easily found elsewhere.

Fordham Radio Supply
260 Motor Parkway
Hauppauge NY 11788-5134
+1-800-695-4848
Tools for technicians. One or two items are not outrageously overpriced.

Jameco
1355 Shoreway Road
Belmost CA 94002
+1-800-831-4242
+1-800-237-6948 (FAX)
+1-415-592-8097
$30 minimum order (was $50), >$5 shipping & handling. Their most recent catalog may have reversed a long trend of abandoning parts in favor of PC compatibles, or it may not; one can always hope.

JDR Microdevices
2233 Samaritan Drive
San Jose CA 95124
Orders: +1-800-538-5000
+1-408-559-1200

FAX: +1-800-538-5005
+1-408-559-0250
Cust. Service: +1-800-538-5001
Tech Support: +1-800-538-5002
BBS: +1-408-559-0253

No minimum, $5+ shipping. Mostly computers now, but they haven't yet decided to abandon components; indeed, they recently dropped their minimum order requirement entirely.

Johnson Shop Products
P.O.Box 160113
Cupertino CA 95016
+1-408-257-8614
+1-408-253-6288 (FAX)
Catalog $1. No minimum. Shipping charge is based on UPS; very small orders that can be sensibly shipped in a first-class letter, include money for first-class postage. New and some used electronic parts.

DC Electronics
P. O. Box 3203
Scottsdale AZ 85271-3203
+1-800-423-0070 (orders)
+1-602-945-7736 (stock/price checks)
+1-602-994-1707 (FAX)
$15 minimum charge order, no minimum for checks, $3 min. shipping&handling. Wide array of ICs, good assortment of electronic components.

EasyTech Inc *** out of business? ***
2917 Bayview Drive
Fremont CA 94538-9932
11 May 93: "EasyTech no longer has an 800 number, and has dropped several lines. The last time I called them (2 months ago), I got the impression they were slowly going down the tubes..." - dts@banyan.com "Both of their 800 number and the customer services numbers are disconnected, and no new numbers are given." - lau@gandalf.rutgers.edu

International Components Corporation
1803 NW Lincoln Way
Toledo OR 97391-1014
+1-800-325-0101 (US & Canada)
+1-503-336-4400 (FAX)
Cabinets&Enclosures; Capacitors; Diodes; ICs; Potentiometers; Resistors; Sockets; Transistors; Books. No minimum order, $2 handling under $25.

Kelvin Electronics
7 Fairchild Ave.
Plainview NY 11803
+1-800-645-9212
+1-516-349-7620
+1-516-349-7830 (FAX)
Minimum order $20; S&H 5% of order ($5 minimum, extra for large stuff,

overnight, export (like to Hawaii :-), and etchant; based on UPS charges).
Lots of electronic parts & tools, some robotics supplies, model rockets.

H & R Company (Herbach and Rademan)
18 Canal Street, P.O.Box 122
Bristol PA 19007-0122
+1-800-848-8001 (Orders)
+1-215-788-5583
+1-215-788-9577 (FAX)
Minimum order $25 ($5 processing charge under $25), shipping $4.75 under $30;
Most items are new overstocks, much regularly stocked stuff as well. Tools,
electrical supplies, motors, mechanical components, robotic components.

SURPLUS ELECTRONICS:

All Electronics Corp.
P. O. Box 567
Van Nuys CA 91408-0567
+1-800-826-5432
+1-818-904-0524
+1-828-781-2653 (FAX)
$10 minimum, $4.00 S&H. New and surplus electronics.

Alltronics
2300 Zanker Road
San Jose CA 95131
+1-408-943-9773
+1-408-943-9776 FAX
Surplus electronics. $12 minimum, shipping per UPS.

American Science and Surplus (formerly JerryCo)
P.O. Box 48838
Niles IL 60714-0838 ### New address.
+1-708-475-8440
+1-708-864-1589 FAX
Surplus. *The* surplus place. Lots and lots of surplus. WWII gun cameras,
velcro, laser disk chassis, 6 volt VW wipers motors, LEDs, rubber brains,
you name it, they've had it. Catalogs are a really good time.
$12.50 minimum order (which includes the $4 shipping charge).

BCD Electro ### Out of the mail order business!
P. O. Box 450207
Garland TX 75045-0207
+1-214-343-1770
According to Barrie Britton (24 Feb 94), BCD has gone out of the mail order
business.

Fair Radio Sales
P. O. Box 1105
1016 E Eureka St.
Lima OH 45802
+1-419-227-6573

Surplus electronics. Heavy on parts for old Collins gear.

Hosfelt Electronics
2700 Sunset Blvd.
Steubenville OH 43952
+1-800-524-6464
+1-614-264-5414 (FAX)
No minimum, $3.75 S&H. Surplus electronics.

HSC Electronic Supply (Halted Specialties Co.)
3500 Ryder Street
Santa Clara, CA 95051
+1-800-4-HALTED Orders only
+1-408-732-1573 inside California and outside US
Surplus (new) electronics; new and used test equipment. Minimum order $10 ($2 handling charge under $20), plus UPS shipping cost. Has three stores, of which 3500 Ryder Street is one.

Marlin P. Jones & Assoc.
P.O. Box 12685
Lake Park FL 33403-0685
+1-407-848-8236
+1-407-844-8764 (FAX)
No minimum ($1 fee for under $10), shipping per UPS. Surplus electronics.

R&D Electronics
1224 Prospect Ave.
Cleveland OH 44115

1540. Re: Cushcraft R-7 ?? Any Good??

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-03 23:53:00 UTC
From: Robert Schnick <qrp@delphi.com>
Message-ID: <ZE2PsE0.qrp@delphi.com>
Source record: 226966

Comparing an R7 (or any other vertical for that matter) to a beam is like the old cliche "comparing apples to oranges". The R7 is a decent compromise for anyone not desiring the maintenence of a beam or lacking the real estate. I used one until the ice and snow took it out last winter. I also recommend the Butternut HF-V9 - great vertical that requires ground radials and patience for tuning it!

FWIW, I looked at them at Dayton and *almost* bought a used one in the flea market asking $1,000 said he'd take $975, I probably would have got it if he'd come down to $900-925.

They were selling brand-new for $1,091 out the door.

The "A" version (with vox) was about another $90.

The 736, which looks like a MUCH nicer radio, also has 6M, would have been about $2K... big price jump there!

In <2psn0m$h5n@apakabar.cc.columbia.edu> mrw13@namaste.cc.columbia.edu (Marc Richard Wollemborg) writes:

>I finally decided on buying a Kenwood TH-78A and am now considering which
>batteries to get with it. There are actually a couple mail order places
>which will ship the radio with a battery besides the standard PB-13. This
>is how the three main Kenwood batteries compare:
> PB-13 Standard 7.2V 700A 2.5W on High Power (approx. 4.5 hrs.)
> PB-17 High-Power 12.0V 700A 5.0W on High Power (approx. 3.0 hrs.)
> PB-18 Long-Life 7.2V 1100A 2.5W on High Power (approx. 7.0 hrs.)

The 7.2V/700mA came with the radio when i got my TH-78E.
It's small and fits completely inside the rig. I mainly use it when i
carry the 78 around. Good for listening but don't talk too much.

The 12V/700mA doesn't make sense to me. It's too large and at 12V the
current goes up to more than 2A, which is too much for 700mA cells.
It's easy to kill a cell by reverse charge and the pack is sealed so you
can't replace individual cells. You get a bit more power out but if the
other side can't hear you at 2.5W it probably can't hear you at 5W. Get
a better antenna instead.

IMHO the 7.2V/1100mA is the best choice. I can chat all night long and
then it won't go down all in a sudden. The charge circuit inside the 78
will only supply about 60 mA of charge current so it takes some time to
recharge, but then you won't overload the little wall cube and won't
do any harm to the pack even if you leave it on for a week.

>There is also the BT-8 battery case which takes 6 AA batteries; what kind of
>output (in watts) does this provide for and how long will it last?

With 6 Duracell alkaline you get 6*1.5V -> 9V. Output power maybe abt
3.5W. I think those cell have a capacity off abt 1700mA. With 6 NiCd
cells you get 6*1.2V -> 7.2V. The sticker on the BT-8 says: don't use
NiCd. Of course i ignored that and got me 850mA cells. The only problem
was that the cells were not charged inside the rig. I was too lazy to
pull them out for charging and modified the BT-8 at bit.

>Additionaly, how about batteries that fit the Kenwood but are made by other
>manufacturers? I'm specifically looking for a "long-life, high-power"
>battery. Any suggestions/recommendations out there? Thanks very much.

Don't know any. Get a BT-8 and make your own pack. Then you can use
any type of cells you want and also can access individual cells. I plan
to get a set of those new NiMH cells that claim a capacity of 1200mA.

Hi,
I urgently need any information available on converting a kenwood tm 742a
(american version) into tm742e or (if possible) the general version tm742e2.
Especially information on modifications of the microphone mc 45 dm
(to obtain an mc 45 dme). Furthermore, I'm interested in remotely
programming the tm742 via dtmf-signals. I have some codes yet, but far off
being complete. Anyone got any information on one of this topics?

F. Kevin Feeney WB2EMS (fkf1@cornell.edu) wrote:
: In article <jefman-270494230322@pme15.pomo.wis.net> Jeff Mann,

: Hi Jeff,
: I've been using quagis on ATV and other stuff for several years now with
: good results. I suspect that the bandwidth of a quagi, though better than
: a straight yagi, is still a bit narrow for a full atv signal, but it
: seems to
: work. I get a low swr for about 3-4 mhz bandwidth typically.

True, if you try to optimize a yagi one element at a time, you do
tend to get a narrow bandwidth. But, it is possible to do much
better with very long yagis. The 1992 Eastern States Conference
has a design by Tom Kirby that has plenty of bandwidth for ATV,
even at 135 cm (I realize the band isn't big enough). From 220 to
226 MHz its gain is from 18.4 to 18.7 dBi, while the SWR is below
1.4 to 1. However, even on 70 cm, 25 elements on a 17 ft boom may
be a little too big for some applications. The 22 element K1FO
yagi for 432 also has a pretty wide bandwidth.

This isn't quite Ham gear but is a great peice of test gear for a shack so.... I have a IFR 1200S service monitor for sale. This unit will operatre from .1 to 999.999Mhz with spectrum analyzer. The unit is less then 6 months old and comes with all manuals and packing materials. If interested Please mail me a inquiry. The unit cost over $11,000 when purchased.
I am asking $9000.

Thank you Mike KB5TOJ

1554. Opinions about IC737/736 6m

Newsgroup: rec.radio.amateur.equipment

From: ham@wam.umd.edu
Message-ID: <2q8ctj$a5a@cville-srv.wam.umd.edu>
Source record: 226981

I'll have you notice just how QUICKLY the IC-737A came out after the 737 came out.

What kind of company today making a $1300 radio would be stupid enough to not give it a VOX circuit?

The ad in QST for the "NEW 737A" said,

"NOW WITH VOX!"

as if that's something revolutionary...

If the 6 meter capability in the IC-736 adds more than $200 to the price, I'm not sure I'd want it - except that I vaguely remember hearing that it actually does 100 watts on 6 meters, which the TS-680/TS-690/IC-726/IC-729 did NOT do. If it had a second SO-239 for a 6-meter antenna, it might be worth another $500 on top of the 737A's price, since it's basically like getting an IC-575H included in your 737.

**Scott Stembaugh, N9LJX noted a problem with Simplex Transmit on hisa ICOM 2AT.....

I had a similar problem on one of my ICOM 2AT's. I made a call to ICOM's service folks and they identified the problem as a bad simplex crystal. They shipped me a new one for about $10 and I made the repair in 15 minutes. I sugggest you give them a call at 206-454-8155. 73 es gd luck de KD1DJ, Al.

1560. Re: Opinions about IC737

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-04 19:26:34 UTC
From: cmoore@mothra.rose.hp.com
Message-ID: <2q8sta$eq3@hpchase.rose.hp.com>
Source record: 226987

I have an IC 737, and I've been really happy with it. You have to keep
in mind, though, that I'm comparing it to my last rig which was a
Yaesu FT-101ZD.

I especially like the built-in tuner and antenna switch. I don't have the
'A' version, but I don't miss the VOX. I never liked VOX much anyways; I
prefer a footswitch.

The dual display is nice -- I like being able to see xmit and recv freqs
at the same time. It's quite easy to tune either one indendently.
The "dual band stacking registers" is a neat function too. I don't know
if that is common on modern rigs or not.

Feel free to email me if you'd like anything more specific.

1561. FT-11/41R PL Tone Problem: Followup

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-04 19:49:29 UTC
From: kennish@kabuki.EECS.Berkeley.EDU
Message-ID: <2q8u89$8ak@agate.berkeley.edu>
Source record: 226988
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

Disclaimer: The following is for informational purposes only.
Use at your own risk, and any liability from using this information
is yours.

History: Those that saw my earlier post are aware that the Yaesu
FT11/41R radios have a problem with the PL tone generation. If
used without the optional FTS-26 tone board, the PL tones are
slightly off in frequency, being too high.

Solution: Yaesu has recognized this as a problem, as has issued
a service bulletin TB9420 to deal with this problem. The fix
involves changing the value of one of the loading capacitors used
with the microprocessor crystal. The principle being that lowering
the clock frequency will lower the PL tone.

Yaesu's bulletin directs changing C2018 (33 pF chip cap loading
the output of the inverter on the CPU) to 39 pF.

Warning: Those of you contemplating this should be made aware that
the chip cap less than 1/2 the size of the COG size chip caps -- I
would not attempt this without a microscope and a FINE tip.

Changing the capacitance to 39 pF did indeed lower the PL tone,
but was insufficient to fix the problem. Only after adding another
7pF (total 46 pF) did the PL done fall within range of a local
repeater.

It may be that this particular situation was bad luck (i.e. high
crystal, low caps, low reed on the repeater).

Yaesu has started using the larger capacitor beginning with
lot 13 (11R) and lot 12 (41R).

If you have a problem with PL tones, and opt to return your unit,
you may want to insist that they check the value of the PL after
the mod -- they may have to put an even larger capacitor in there
(e.g. 47 pF)

I am happy to report, however, that the above mod has fixed
the PL problem for me, and the local repeater now likes the 41R.
Other than this minor (albeit frustrating) glitch, the 41R
is a neat unit. VERY small -- less than 1/2 the size of the 530,
and performs well for its size. The standard 4.8 V pack is
compact, but keeps the power output to 800 mW on high and 200 mW

on low, which may be a problem for those hard of hearing repeaters.
Speaker audio is improved over the 530. Your mileage may vary.

Related Item:

The extended RX/TX mod for the 41R is identical to that for the 11R.

-Ken

1562. Re: FT-5100 features (was Re: Question about dual in-band rcv)

Newsgroup: rec.radio.amateur.equipment

From: dbhopper@eos.ncsu.edu
Message-ID: <2q92bd$o6k@taco.cc.ncsu.edu>
Source record: 226989

Has anyone had any problems as the result of excessive heat with the
Yaesu FT-5100? Some say the heat-sink is too small. Anyone running
9600 packet with one? According to QST, the data port is now
optimized for 9600 packet. Can anyone confirm this? If I buy one,
this will be one of the big requirements for it.

And I assume the pinout for the data port is in the radio's manual.
Hopefully you don't have to buy the service manual?

Thanks!
Dan

Source record: 226898

I've got an MFJ-812B VHF SWR/Wattmeter that has died less than a
year after purchase. I really can't think of what I might have done to
it. It seems to have died in the last transit from home to school.
The wierd thing is that although the meter shows no signs of life,
I can leave it in series and it will pass the RF through no problem. I
opened it up, but I really have no idea what to look for. I've never
sent more than 5W of 2m RF through it.
Anybody else have a clue? Or do I just live with it and buy from
a different manufacturer in the future?

From: Sandy Dumitru (sandy.dumitru@kandy.com)
Newsgroup: rec.radio.amateur.equipment
Subject: Older ham gear (antiques?)

I have an assortment of mostly older ham gear which must be sold.
These belonged to my father (W4IXJ, and formerly W2IXJ), who passed
away recently. I'm hoping that some knowlegeable hams out there
can help me determine appropriate selling prices for these items.
I don't know if they'd be considered relics or antiques, but here goes.

1) Hammarlund HQ One-Seventy
2) Heathkit Apache TX-1 (it weighs a ton!)
3) Heathkit Power Amplifier (goes with #2) (it weighs a ton too!)
4) Lafayette Slim Crystal Mic PA-42 - still sealed in plastic bag!

Also:

Swan Cygnet 270
Azden PCS-4000 (2 meters)

Any clues as to the value of these items is greatly appreciated.

Thanks,
Sandy Dumitru

From: MSUORANTA@FINABO.ABO.FI
Message-ID: <1994May5.064738.18558@abo.fi>
Source record: 226901

I need to get a new HF-rig, mainly for just rag-
chewing and some CW-work...so I need not invest
too much money to some high-tech wonder. I would
also like to get broadcast band receiver coverage, and
not just on shortwave but AM plus longwave as well.

Icom IC-707 and Yaesu FT-840 are both reasonably priced
for a student :), and seem to have BC-receiver as well.
How low does it tune? I would like to receive some local
weather and time stations around 100..130 kHz as well..

How about ham bands? Narrow CW-filters? Can max output power
be controled and turned down to QRP-level..some 1..5 watts?
Need that for low power contests and in case of serious TVI-
problem-QTH's.

Anyone used those rigs in below-freezing temperatures? I would
like to do some /M and /P operations in winter...

1572. Help with TS450S install in Toyota Truck

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-05 09:17:37 UTC
From: brad@ecst.csuchico.edu
Message-ID: <2qadjh$a3j@charnel.ecst.CSUChico.EDU>
Source record: 226905

I sure hope someone out there has had some experience in this. I have
been trying to install a Kenwood TS450S/AT in my "89" Toyota 4x4 SR5
extended cab with a gemtop camper shell. The antenna is the Lakeview
ham sticks and is mounted by the usual method to the solid steel custom
built bumper. I went out and purchased several of the 1" wide 8-10"
long grounding straps and have ground the following to the frame;
pickup cab to the frame
pickup bed to the frame
each side of the engine block to the frame
at a point ahead of the muffler just after the header to the frame
at a point just behind the muffler at the tail pipe to the frame

With the engine off the radio has a nice S1 or 2 noise level and
when I turn on the key the level does not change. But when I start
the engine and it is turning over the noise level shoots up to a
S9. It seems no matter what I do I can not suppress this static noise.
the noise level goes down as the RPM's of the engine are increased. The
other thing is I have disconnected the antenna with the engine running and
there is no noise so I guess I can eliminate noise filtering in on the
DC line. I can only assume that the noise is being generated somewhere
either under the hood (by the way the hood is grounded to the body of
the truck with a gound strap also) or by the computer system which is
located inside the cab at the right side kick panel. I also tried wrapping
the computer in aluminum foil with no luck. I figure that the noise
or shall I say the RF is being generated by some component in or on the
vehicle and being picked up by the antenna......

My Question is this how the Hell do I get rid of this...static noise
it is driving me nuts and making mobile HF operations impossible from
in side of this moving RF generator......

Please Help...

Thank You

Brad.....

I'll suggest what I use for my scanner with a belt clip, a book
end. Yes, a book end. Bend the back of it back in the
direction of the long (under book) tongue, then either put glued
rubber feet on it (I'd suggest 3) or some hot melt glue or
silicon sealer on the bottom then just drop your unit onto the
new stand. Very stable and $1.50 in single prices. :)

From: khopper@kimbark.uchicago.edu
Message-ID: <1994May5.142624.19500@midway.uchicago.edu>
Source record: 226902
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.misc

I saved a few $$. Currently using a Ten Tec Omni-V and looking
for an upgrade to a new rig. {I don't hear anything about a new
OMNI-7 ?? did anyone pick up on any rumors at Dayton ?}

What do you recommend for HF PacTOR ? something that will grow
with new PacTOR modes (PSK ?), run 300 baud G-TOR and have sufficient
audio bandpass,filters selection etc ?.

I see that only the Yaesu has a "RTTY" and "Packet" connector on
the back of the rig. But since most of PacTOR is/will be LSB and
not use the FSK capabilities of the rig - is there an advantage ?

Any suggestions welcomed.

TNX,

The HTX202 is a pretty darned good radio for the money, Scott. The receiver is tight and sensitive, moreso than most of the other HTs that hear from DC-to-daylight. The 202 was made so that it will not be modifyable to hear out-of-band signals, intentionally or (hopefully) accidentally. That means that though you can't make it hear your local taxicabs on purpose, it shouldn't pick 'em up as images, either.

Battery packs are available - it uses the Icom-style battery packs that were on the larger IC-X and IC-0X radios (i.e. IC-02AT). The charger for those size batteries is available, too, from most battery vendors, or you can probably pick up a used Icom charger easily enough at your local swap meet.

I bought one right after they first became available, here, and haven't been sorry - I normally don't use 2m every day, but it gets lugged around with me just in case.. it's been dropped, run over by a bike, rained on, and yelled at (well, we do have some very irritating people on 2m around here! <grin>), and it just keeps on playing.

All in all, my opinion is that it's a very good buy for someone who doesn't need a dual-bander, or who does not need out-of-band operation (like for MARS or CAP), or who wants to listen to the cops (it can't be modified to receive out of band - I'm emphasizing that because that seems to be the one thing people get miffed about - buying it expecting that a mod is available, and then finding out that it's not.).

I consider a purchase of DSP-9, 9+ or 59. How effective is the noise reduction there? At home often I hear a steady power noise that is too complex to be cut out by noise blanker. Will Timewave DSP help?

1580. Kenwood TS-850S Mods

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-05 14:49:37 UTC
From: rob@jbasp.demon.co.uk
Message-ID: <2qb121$nal@gold.jba.com>
Source record: 226900

I'm using a TS-850S primarily as a driver for transverters for VHF & UHF, but I am FAR from convinced of the reliability of the recommended arrangement for transverter driving (+12V on the inner of the IF out connector to disable the PA stage). Having already melted an admittedly naff 144MHz transverter, does anyone have information on mods to do the following:

A method of determining when the radio is in Transvert Mode ie. the display is showing 50/144/432 MHz etc. I presume that somewhere on the control board there is a line(s) which indicates this state. Given that, it becomes an easy matter to disable the PA stage as appropriate.

Any suggestions would be most welcome, including any explanation as to why Kenwood forgot to provide this bleedin' obvious feature themselves.

The 28A (Monoband tx) uses the same batts and I've been fairly happy
with the supplied batt-pack. I did buy the BT-8 too. What I've been
wondering is what happens to the alkaline batteries if you plug in
the wall charger, or 12Vdc adaptor - surely it wouldn't try to
recharge the alks!? BTW Kenwood says DO NOT turn the radio on, much less
transmit when charging the NiCads with the supplied charger. Their
reason was the charger is not regulated...oh well...

: 3) Heathkit Power Amplifier (goes with #2) (it weighs a ton too!)
: 4) Lafayette Slim Crystal Mic PA-42 - still sealed in plastic bag!

It's hard to set a value. Someone who knows what they are and wants
them would pay real money, while many would pay to have the stuff
hauled away. :=)

I used to have a TX-1 as my main station transmitter. Worked great
on CW, and there was a companion SSB converter (SB-10) available for
it so you could get on phone. I'd say $50-$75 if it's in decent
condition. I'm less familiar with the HQ-170, but I'd guess maybe
$50 if in good condition.

That's assuming you can find that motivated buyer.

Source record: 226910

My CDR "CLACK-CLACK" rotator drives my XYL crazy in the wee hours of the morning, while she's sleeping and I'm tuning the bands. I work mostly CW using headphones to stay quiet, but the rotator control's noise gives me away.

Does anyone have a good design for a control box for that rotator -- one that won't wake the dead? It could be either a mod for the existing control box, or a completely new one.

Thanks...

well. . .let's just say that somebody's girlfriend plugged the ac adapter into the charge (instead of into the dc jack) jack when his pro-43 was loaded with energizers. Well, he got battery "acid" (base) all inside the radio, and said that some stenciling was gone, and the circuit board discolored. How would you propose the battery pack know whether it was loaded with nicads or alkalines??? The adapter just serves to provide current!

Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.swap

I am looking for:

1) Comments about the Icom 551 6M multimode from people who have experience with that radio. I know very little about it. Is the transmitter clean? What about receiver sensitvity and selectivity? (I want it primarily for use at a multiop contest station which is running pretty fair power on other bands. I thus want a receiver that hears well but won't get trashed and I want a transmitter that won't trash the other bands). Is it reliable? Is the firmware going to disappear when the lithium battery goes dead? I assume that it is capable of FM, for both simplex and repater use. Are there option boards to look for (filters, CTCSS, etc)? Does it come in high and low power models (A & H)? What kind of power output can I expect? Is it adjustable? Is there else anything I should know about it before buying one? What is the going price for a 551 in good condition?

2) Somebody who has a 551 to sell (presuming that I hear the right answers to the above questions).

-Thanx

I use the TS850S/AT by Kenwood on Pactor; Pactor is my favorite mode. I use it with the optional dual 500 Hz filters in FSK mode. Most Pactor users use the FSK mode as opposed to AFSK on SSB.

The TS850S/AT is probably unsurpassed as a Pactor rig. The filtering, if you use the dual 500 Hz filters in FSK mode, is about as good as filtering gets: you can pull in the weakest Pactor signals and achieve a good qso. The rig also has SELECTABLE FSK WIDTH, which most of the rigs lack, therefore you can set your FSK to the optimal, 200 Hz as opposed to getting by at 170 Hz which is what most rigs offer. I recommend the 850 strongly.

I use the Timewave DSP 59 and find that it is occasionally helpful, and is definitely a "nice to have" accessory. But the 500 Hz filters in the 850 are more important to have than the outboard DSP unit, in my opinion.

Hope this helps!

1590. Icom 3220 problems

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-06 04:10:35 UTC
From: n4tii@kd4nc.uucp
Message-ID: <1994May6.041035.24419@kd4nc.uucp>
Source record: 226917

Hello Sports Fans...

I have a friend that is having problems with his Icom 3220 dual band mobile radio. Here's what's wrong with it...

On VHF band only, when the radio is keyed up, the rig show that it is in the TX state (the TX illuminates) but the S/RF bar does not "go across the display." This is true for all power levels....

In UHF band, the radio performs as normally.

On VHF, there is RF getting out, as the radio will key the local repeater, but nothing else.... I have yet to get the radio out to check the signal coming out or the power....

William, N4SZP, the owner of the thing, reports that the radio started acting up after a real HOT day in Alabammy...it was so hot that the window blew out of his vehicle... so...possibly something got REAL hot on the radio and failed...

Oh well..anyone got any ideas on what's screwed up on this thing? I've recommended that he do a "Reset" on the radio but he does not know how to do it....and I've yet to take a good look at the radio to see what the problem is...

Thanks for the help!

John

From: Aaron Wohl <aw0g+@andrew.cmu.edu>
Message-ID: <ohmWuJS00WA1IOFV4k@andrew.cmu.edu>
Source record: 226919

ICOM W2A
On 440mhz transmit the red led would pulse once or twice a second. The power drawn on transmit dropped down as the led pulsed. Checking the power out with a meter it pulsed down to zero in time with the led and power. The problem used to go away if the unit warmed up (xmit into a dummy load for 60 sec at full power). But lately it had been still ticking no matter what and I couldn't get a packet connection.

I posed to this list before and got six replies about grounding problems / plug connection problems in the 440mhz module. So last night I got out the jewelers screwdrivers and magifying loupe (sp?) and took it apart. I took out the 440mhz module and opened it up. Indeed there where two places where the shielding had problems there was a piece if tin that was supposed to apply presure to a module for a ground that was out of position and a one doubious solder joint. I bent the spring into position and twisted a piece of tin to put more pressure on the questionable joint. The joint was not reachable with the the smallest soldering iron tip I had due to components around it.

I put it all back together and it works fine now. One post said that icom fixed his rig out of warenty for free saying it was a "cracked solder joint on 440mhz VCO".

How are the rest of you W2A owners fairing in the 440mhz ticking battle?

One question more. Does DSP-59 deteriorate the signal quality of
good-sounding signals? Radio Shack DSP does, particularily in CW
modes, and N0ZEM has noticed the same with DSP-9 in the narrow CW
position.

I compared RS DSP with my home-build two-pole analog audio filter.
Even though RS skirts were much sharper,the analog one was more
pleasant to use, more efficient in digging out weak signals, and made
copying all signals more comfortable than the RS DSP. Perhaps analog
filters have much lower nonlinear distortions. Why am I still looking
for a DSP: mu analog filter is not immune to RF, copies a strong
local FM station, and has some hum.

Source record: 226922

I will be buying a dual-band mobile in the next few days and would like some advice. I need a radio with detachable head (or no head) because of limited mounting space in my Caravan. I have eliminated the Yaesu based on comments of owners. I have eliminated the Kenwood 942, ICOM 901 and ICOM delta 100 based on price, but I may pick one up if the price is right. I have narrowed my selection to;

Kenwood TM-733
Costs a bit more that the 732. Does AIP improve intermod?

Kenwood TM-732
I've heard comments complaining of severe intermod problems.

Kenwood TM-742
I've heard nothing but praise for this one. A buddy has 2 741's.

Standard C5718
This looks neat and they have a good reputation. Is the head in the microphone a good idea/implementation?

ICOM IC-2700H
This is new - just saw the first ad yesterday. Has remote head. Any info on features, anyone see one at Dayton?

I appreciate any comments that you can email me today. The reason for the rush is that if I decide on the Kenwood 742, the $40 coupon expires tomorrow. Thanks...

1595. Kenwood TW-4100A mods?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-06 15:05:59 UTC
From: BIDDLEAP@ctrvax.Vanderbilt.Edu
Message-ID: <1994May6.150559.28420@news.vanderbilt.edu>
Source record: 226924

I have a TW-4100A which is a good mobile rig except for one quirk. Most rigs have a repeater offset select button which toggles -/simplex/+ and possibly other options. The TW-4100A has a similar button, but it only toggles between simplex and the offset direction you selected in the configuration setup, along with the power level, scan step size, etc, etc. i.e. -/simplex or simplex/+. While it will memorize the offset in a memory channel, when you are on the road and scanning, you have a 50-50 chance of having to change the setup in order to use the repeater.

Besides being a royal pain, it is a minor safety problem. I have looked at all the mod data bases I know and haven't found anything, so I was wondering if anyone had heard of a mod to allow the normal -/simplex/+ offset toggle?

I have had one of the Radio Shack 2m Rigs for some time and think that
it is well worth the money. It has a couple of shortcomings but
they are no big problem. They don't offer a case for it other than
their generic scanner case that is about 5 sizes too big. I just
made a trip to my local Tandy Leather store and the lady there made
a very nice leather case for it out of upholstery leather. The other
small problem is that the receiver is too hot for its own good. I work
in an area that has more antennas per square INCH than my front lawn
has grass! It is very sensitive to intermod. However, the repeaters
that I frequent all transmit a tone so the intermod can be dealt with.
It is a little strange however to see the S-meter jumping up and down
with no audio.
I am very satisfied with the battery that comes with it. I try to run
mine down about once a month. It takes 18-20 hours to do so from a
full charge. You can accelerate that by opening the squelch or turning
on the light. The light will go out when the BAT indicator comes on.
It has an auto-shutdown so it won't kill your battery. I think that
Radio Shack should have come out with a dual-bander in stead of
two separate rigs. Other than that I would recommend it to anyone
who is looking for a good inexpensive 2m rig.

I have the Timewave DSP-9 and have noticed that it has a problem with
complex noise such as RFI that comes from a computer or other
electronic equipment. It will however do a pretty good job of
taking care of the buzzing that comes from high power lines.
I also have a very old cordless phone that puts a hissing noise
on 40, 80, and 160 meters. The DSP-9 takes care of that quite nicely.
It is not a miracle cure, but it does a pretty good job.
It reduces the noise anywhere from 10 to 20db depending on the
type of noise. Where the DSP-9 really shines is on SSB and CW modes.
It does a wonderful job of removing carriers in the SSB mode and the
filter skirts on CW are very sharp and it doesn't ring at all.
I also have the Radio Shack DSP-40 and it compares very well with the
DSP-9 in all features except the NR mode. If you need the NR function
buy the DSP-9. If you really don't need the NR function but need good
SSB and CW filters, buy the DSP-40 from Radio Shack. I have both and
for the little extra money I would buy the DSP-9 from Timewave.
My rig is a Yaesu FT-890/AT.

1598. FT-530 AM Mode on 800 Band Possible?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-06 16:58:54 UTC
From: ken@boxhill.com
Message-ID: <2qdt0e$490@boxhill.com>
Source record: 226926

Can other owners confirm the following limitations of the
AM mode on the FT-530?

VFO Band AM Possible?
----- ------ ------------
Left 2m Yes
Left 70cm Yes
Left 800Mhz No (neither AM nor FM. Not tunable)
Right 2m No
Right 70cm No
Right 800Mhz No (FM Only)

I ran across this limitation of the right-hand VFO when
trying to listen on the 800 Band in AM.
Doesn't appear to be possible.

Anyone else try this?

(Replies cc:'d to ken@boxhill.com appreciated)

1599. Opinions on Yaesu FT-707/FV-707DM/FP707/FC-707?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-06 19:44:22 UTC
From: ham@wam.umd.edu
Message-ID: <2qe6mm$3ob@cville-srv.wam.umd.edu>
Source record: 226925

Are there any popular opinions on this particular combination of parts?

FT-707, early-1980's solid state, compact SSB XCVR
FV-707DM, Digital VFO with 12 memories (external)
FP-707, matching 20 amp power supply (50% duty cycle) w/built-in speaker
FC-707, matching 150 watt antenna tuner with 50 ohm dummy load built-in

Anybody ever own this station (or parts thereof) and can therefore comment
on its quality, performance, etc.?

I'm interested in getting opinions as to which of the four Kenwood speaker-mics would would be best for use in a high noise environment. Basically I'm going to be carrying my HT around an airport tarmac and I want to know which speaker-mic would have the best audio output with the volume turned up.

Thanks,

Marc Wollemborg

I did read somewhere (I think the person who wrote the (non-)mod sheet for the radio that some units had a problem with the zeners getting too hot if running from external power along with the battery attached. The recommedation was to be safe, and disconnect the NiCad pack...

Scott Richard Rosenfeld (ham@wam.umd.edu) wrote:

: If the 6 meter capability in the IC-736 adds more than $200 to the price,
: I'm not sure I'd want it - except that I vaguely remember hearing that it
: actually does 100 watts on 6 meters, which the TS-680/TS-690/IC-726/IC-729
: did NOT do. If it had a second SO-239 for a 6-meter antenna, it might be
: worth another $500 on top of the 737A's price, since it's basically like
: getting an IC-575H included in your 737.

The 737/737A/736 radios come with two SO-239 connectors. You can set them
up to automatically change based on the band. The rigs also automatically
remember the last tuner setting based on the band and antenna setting. Changing
bands or antennas couldn't be faster or easier.

The 736 also contains a built in power supply. Some feal this is an advantage.

The 736 also appears to have an SWR meter built in. My 737 does not.

The best thing to do with this kind of radio is to use it as a cross-band repeat hand-held thru another kenwood base or mobile doing the cross-band-repeating, such as a 732, 741, 742 etc. Then you can run the milliwatt power level, run it all day, never worry about running out, and always have a plenty good signal. Write me for more comments if you please.

1607. Heil 4 or 5 element??

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-08 01:32:00 UTC
From: pete.wildman@pplace.com
Message-ID: <5c.1206.18.0N17BEE9@pplace.com>
Source record: 226936

Bob, I think you will find that the decision may depend on YOUR voice. I'd try to borrow a dual element(4&5) desk mic from someone and try some on the air testing. I have 2 dual element desk mics, and one #5 Proset. Almost all of the time I use the #5, and I get MANY unsolicited compliments about audio, both in contests and during day-to-day operation. However, there comes a time for the #4 element-when the band is noisy, copy is marginal, or the pileup is big and loud (which one isn't?). In those situations I find that the #4 gets my call recognized and copied faster. I have done away with all the stock microphones (except 1) and use the Heil setup. Rigs that I am using with these microphones are FT1000D, FT890, and OMNI-VI (model 705 desk mic they sell is NOT BAD at all)

Best of luck with your decision-they are a very pro-customer company and back their products up well!

Pete/KR4PU

The HTX-202 is a superb radio for the money. Bullet proof receiver with great transmit AND receive audio. Only problem is it is larger than most portables and due to its receiver being optimized for the ham band, it will not go out of band.

I use one for a dedicated packet station, and it is great to have a 2m radio that won't go spastic when you put a real antenna on it

No. RTTY is narrow band FSK. Modems don't do that narrow a band,
but use as much of the the full 300 to 3700 Hz bandwidth as they can.
They actually put out an audio carrier. What you want to do is shift
your RF carrier with the RTTY signal. So the RTTY pulses would be fed
into the transmitter oscillator or VCO. If you have an RTTY, it probably
puts out current loop, and most modems don't handle current loop.

1611. amps with HT's?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-08 17:59:20 UTC
From: JBAACK31@MAINE.MAINE.EDU
Message-ID: <94128.135920JBAACK31@MAINE.MAINE.EDU>
Source record: 226938

This might seem a silly question, but can you run an amp to a HT ? The model I have in question is the Rat Shack 2meter. Looking for that additional strength to make those long repeater calls. If so how much do they cost? I am looking for something small 50w or less.

Thanks Jason

1612. VC-22 HT VOX Headset with mobile?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-08 18:56:58 UTC
From: landmann@myhost.subdomain.domain
Message-ID: <2qjclq$omt@news.doit.wisc.edu>
Source record: 226937

I have the Yeasu FT-11R HT, FT-2400H 2M mobile, and the VC-22 VOX headset, which I purchased for the FT-11R. Is there a way I can interface the VOX headset to the mobile radio? The HT is keyed by grounding the mic line through a resistor, the mobile through a PTT line.. Can I build a simple box to make this work? I use the mobile as a base, and would really like to use the headset.

Thanks much for all replys..

1613. Older ham gear (antiques?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-08 22:01:00 UTC
From: art.harris@woodybbs.com
Message-ID: <93.88.7583.0NFB272D@woodybbs.com>
Source record: 226859

SA>I have an assortment of mostly older ham gear which must be sold.
SA>These belonged to my father (W4IXJ, and formerly W2IXJ), who passed
SA>away recently. I'm hoping that some knowlegeable hams out there
SA>can help me determine appropriate selling prices for these items.
SA>I don't know if they'd be considered relics or antiques, but here goes.

SA>1) Hammarlund HQ One-Seventy

This was a nice receiver in the '60s, but not very practical in the 90s.
Still, a lot of folks woudn't mind owning one. I'd say a fair price
would be around $75 to $100. If it's in mint condition, this receiver
could be considered a classic and might be worth a bit more to nostalga
buffs.

SA>2) Heathkit Apache TX-1 (it weighs a ton!)

This is an AM (Amplitude Modulation) rig, commonly referred to as the
"Scratchy Apache" because of its grainy audio. Just a few AMers left in
ham radio, and they tend to go for other rigs. I'd say this is also
worth about $75 to $100 if you can find someone who wants it.

SA>3) Heathkit Power Amplifier (goes with #2) (it weighs a ton too!)

I'll pass on that one.

SA>4) Lafayette Slim Crystal Mic PA-42 - still sealed in plastic bag!

This is a give-away item. ;-)

SA>Also:

SA>Azden PCS-4000 (2 meters)

If it's in operating condition, this would be the most usefull item on
the list to most hams. I'm not familiar with this rig, but if it's a
synthesized rig (as opposed to crystal control) in the 25 watt class,
it's worth around $150.

Best wishes,
Art N2AH

1614. RE: 2m HT: Opinions Plea

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-08 22:01:00 UTC
From: art.harris@woodybbs.com
Message-ID: <93.87.7583.0NFB272C@woodybbs.com>
Source record: 226860

In a previous post, Kevin related his experiences with the HTX-202:

MU>I have had one of the Radio Shack 2m Rigs for some time and think that
MU>it is well worth the money. It has a couple of shortcomings but
MU>they are no big problem.

MU>small problem is that the receiver is too hot for its own good. I work
MU>in an area that has more antennas per square INCH than my front lawn
MU>has grass! It is very sensitive to intermod. However, the repeaters
MU>that I frequent all transmit a tone so the intermod can be dealt with.
MU>It is a little strange however to see the S-meter jumping up and down
MU>with no audio.

That surprises me, Kevin. All the reviews I've seen say the "202" has about the best immunity to intermod of any HT because of the fact that it's strictly a 2-meter receiver (no out of band receive). What kind of antenna are you using with it and how close are the offending transmitters?

MU>I am very satisfied with the battery that comes with it. I try to run
MU>mine down about once a month. It takes 18-20 hours to do so from a
MU>full charge. You can accelerate that by opening the squelch or turning
MU>on the light. The light will go out when the BAT indicator comes on.
MU>It has an auto-shutdown so it won't kill your battery.

Why do you do this? I know there are differences of opinions regarding the "memory effect" of NiCads, but I think deliberately discharging NiCads will shorten the amount of use you get from them. I usually let mine run down naturally, or I'll just top 'em off with a few hours of charge if I plan to use an HT all day and don't want to get caught short.

MU>Radio Shack should have come out with a dual-bander in stead of
MU>two separate rigs. Other than that I would recommend it to anyone
MU>who is looking for a good inexpensive 2m rig.

I hear they're planning on doing that!

73,
Art N2AH

The West Marine master catalog has some details about the three stages
of charging Gel Cells. They also have some very nice, new generation,
microcontroller controlled switch-mode chargers. Get the 800 number
from (800)555-1212.

Hi,

I have a YAESU FT-5200 that has one of the LED's burned out. Is
it possible to replace or does it need to go back to YAESU? Has
anyone done this job themselves?

Thanks

1628. Help needed identifying old gear

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-09 17:14:07 UTC
From: doheare@jetform.com
Message-ID: <9405091245.AA17896@jetform.com>
Source record: 226853
Cross-posted to: rec.audio.pro,rec.radio.amateur.equipment

This is sort of off-topic, but not too far. At a very odd garage sale this past weekend, among piles of paper-tape readers and TI Silent 700 terminals, I spotted (and bought) a tube audio generator. I planned to scavenge it for parts to build a guitar amp, but now I'm not so sure.

It's a Hewlett Packard model 205A audio generator, serial number 22. It's in a nice oak cabinet that appears to be original. It's got an apparently conservatively rated 5 watt audio amplifier -- 2 6L6 in push-pull. The 6L6s and most of the other tubes are metal cans, not glass. The manual is five typed pages, and appears to be either a carbon copy (it's on onionskin) or maybe a hectograph; it's not printed.

What the heck is this thing? Can anybody date it? IEEE Spectrum did an article on HP a few years ago that said their 1st product was the model 200A audio generator, in 1938. I'm *NOT* going to salvage parts from it to build a guitar amp. Does anybody want it to restore, or for a museum piece or whatever? Does HP have a historian?

Feel free to e-mail me. I don't want to get _too_ far off-topic :-)

Bradley Lee Ambers (brad@ecst.csuchico.edu) wrote:

: I sure hope someone out there has had some experience in this. I have
: been trying to install a Kenwood TS450S/AT in my "89" Toyota 4x4 SR5
: extended cab with a gemtop camper shell. The antenna is the Lakeview
: ham sticks and is mounted by the usual method to the solid steel custom
: built bumper. I went out and purchased several of the 1" wide 8-10"
: long grounding straps and have ground the following to the frame;
: pickup cab to the frame
: pickup bed to the frame
: each side of the engine block to the frame
: at a point ahead of the muffler just after the header to the frame
: at a point just behind the muffler at the tail pipe to the frame

: With the engine off the radio has a nice S1 or 2 noise level and
: when I turn on the key the level does not change. But when I start
: the engine and it is turning over the noise level shoots up to a
: S9. It seems no matter what I do I can not suppress this static noise.
: the noise level goes down as the RPM's of the engine are increased. The
: other thing is I have disconnected the antenna with the engine running and
: there is no noise so I guess I can eliminate noise filtering in on the
: DC line. I can only assume that the noise is being generated somewhere
: either under the hood (by the way the hood is grounded to the body of
: the truck with a gound strap also) or by the computer system which is
: located inside the cab at the right side kick panel. I also tried wrapping
: the computer in aluminum foil with no luck. I figure that the noise
: or shall I say the RF is being generated by some component in or on the
: vehicle and being picked up by the antenna......

: My Question is this how the Hell do I get rid of this...static noise
: it is driving me nuts and making mobile HF operations impossible from
: in side of this moving RF generator......

: Please Help...

: Thank You

: Brad.....

I have no direct experience with this, but assuming you have an EFI
engine, there's been several postings saying problems like this can
be caused by the electric fuel pump. One cure was the Radio Shack
snap on ferrite chokes, or a bypass capacitor may be needed in
bad cases. The parts need to be install as close to the fuel pump
as possible. Let me know if this is what caused your problem, please.

I thought they were almost identical to standard lead-acid batteries.
If so, then I think you want to charge them with a current-limited
constant-voltage source, similar in function to the voltage regulator
in an automobile.

: have in question is the Rat Shack 2meter. Looking for that additional
: strength to make those long repeater calls. If so how much do they cost?
: I am looking for something small 50w or less.

: Thanks Jason

Ramsey Electronics sells a 2m HT amp (25-30 W out, or so) for $80, or
so. It works more-or-less. Mine died after a couple years of normal
use. Currently, I'm using a/the Alinco HT amp (5/3W in, 35W out). I
don't remember the model number offhand. I wrote to Alinco about
getting more of the molex connectors they used on the power harness,
but they said that that model is discontinued. Oh well. As
for benefits, more power to hit those fringe repeaters. AS for
problems, I have to turn off the pre-amp when I'm in town.

1633. AM receive bandwidth, Yaesu990

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-09 20:23:39 UTC
From: hawley@aries.scs.uiuc.edu
Message-ID: <hawley.768515019@aries>
Source record: 226858

I find that the Yaesu 990 lacks hi's on receive AM, compared to my Knwd 850...or any thing for that matter. Whilst I had the IF board out to install 500CW filter, I tried a 1uf cap across the 6KHz AM filter. It had no effect, the Yaesu still sounded quite rolled off on the highs. Does anyone have experience w/ this "problem" ... any fixes? Is the rolloff due to something other than the AM selected 10 and 6 KHz filters? Is that something switched in for AM? Is the AM detector limited in bandwidth?
Over.

Thanks, Chuck Hawley-KE9UW-Urbana Illinois.

Source record: 226870

Howard, I've had a FT-2400 for about 1.5 yrs now and it's safe to say that I've put it through more hardship than most people would. It was purchased based on the claims of ruggedness and reliability. It was promptly installed in a convertible, i.e. a OHV jeep without a hardtop. It suffered extremes of temperature (below 0f and above 100F). It was run at full power almost exclusively. It was rained and snowed on (except the mic, which was stuffed up behind the dash most nights) occasionally, covered in dust most of the time, due to the fact that the soft top was less than air/weather proof. Then I sold the jeep. So I sponged the radio off, fabricated a 8pin rj packet connector for it, and it's been running almost continuous duty packet (interrupted by occasional voice use). I've never had a problem with it. Before this starts to sound like a Yaesu commercial I should add that I've never had a problem with ANY of the VHF/UHF mobile radios I've owned (Yaesu/Kenwood/Standard-no Icom). However, the 2400 is the only one that got treated that poorly. So, draw what you will from my experiences, but I like my 2400.
Hope you like yours. Pete/KR4PU

1639. Newbie WARNING to fellow Newbies

Source record: 226866

I just found something out -- the hard way!!

When I'm mobile, I usually take my HT along. Since it's (nearly) summer here in Chicago, I drive with the windows open. Due to the wind noise, I have to turn the HT volume way up.

WARNING from a now-wiser newbie:
DON'T crank the volume if you're using a speaker-mic!
It works fine as long as you're straining to hear those faint stations thru the wind noise in the car...

But as soon as somebody calls up the autopatch, the HIGH-VOLUME dial tone blows your speaker :(

Note that a loud voice has never hurt my equipment (voices have alterations in pitch and volume) but a continous unrelenting buzz (like a dial tone) fries that puppy REAL fast!

>a good rig. I know it's a little late, but could anyone share
>their experiences with me?I hope this note comes out well as

Good radio! I used one for 6 months, and only sold it because
(a) it spent 99% of its time in the shack, so an HT was adequate
for mobile use; and (b) I wanted a multimode rig (got a Kenwood
TR-751A). The -2400 is rugged, reliable, easy to use/see in the
car (big display), and pretty easy to figure out function-wise. I
had just gotten good at it when I sold mine.....

My HT is a used FT-411E, also a good radio.....but the display
is small, which is a pain.

That's OK, Ken, you aren't missing anything. Nobody runs AM on 800 MHz in the USA because the FCC generally does not allow it on any land mobile band anymore. Therefore I would expect that the AM mode is in the radio ONLY for aircraft band reception from 108-136 MHz because that's the only place they still use AM.

Hi, Larry. Certainly the most accurate source is always going to be the
manufacturer of the cells. In this case that is Globe Union, now the
Battery Division of Johnson Controls. You can call them at (414) 228-2393
or write to them at P. O. Box 591, 900 East Keefe Ave., Milwaukee, WI
53201.
By the way, on this net, the proper distribution is USA, not NA. Amateur
packet uses the .NA or .WORLD but here on Internet it usually puts your
message into the router's bit bucket.

Try using an earphone or VOX headset while mobile. The volume doesn't have to be turned up as loud which saves on batteries. Having the sound source sticking in your ear makes it a whole lot easier to hear than a sound source two feet away. With the windows open I doubt the VOX would be useful, in that instance just use the PTT when you want to transmit.

What are the legalities of using a headset/earphone while mobile? I searched the Indiana Code index the other day and didn't find anything related to it.

Howdy...

Would anyone out there happen to have a 24VDC/20 amp. power supply
hanging around their shack needing a good home? I need one to power a
PRC-47 (Military...hence the 24 volts...:-)
If you have a spare one that you'd consider selling for a reasonable
price (Read that: VERY CHEAP! :-), please drop me an e-mail to:
phantom@pro-haven.cts.com
and NOT to the address above as it will be inactive soon and I
won't be able to receive any mail there.....I'd really prefer something
around the Lone Star State here because a power supply this big is probably
a boatanchor, weighs a ton, and shipping it would be really tough.....
Thanks es 73!

I'm thinking about a portable all-mode 2M rig for mountaintopping and VHF contesting. It would be nice to have for mobile and the sats too. Does anyone have any opinions on the Yaesu FT290 mkII? Is there anything else available that would work here? I had heard there were some front end problems with these in the past. Is this (still) the case?

Any opinions would be appreciated.

Thanks,
Joe

Excellent idea, as I have used the kenwood headset and it is the
best way to operate mobile. However, the kenwood hmc-2 is
prettyy flimsey and i would not buy another, which is what i have
to do now that my first one failed!

I am looking at the diawa set for kenwood, it looks like
a sturdier unit.

From: ed@fore.com
Message-ID: <CpnAMv.14G@fore.com>
Source record: 226882

I have had one of the Radio Shack 2m Rigs also.
I also have a vintage icom ic2at (thumbwheel tuned ht)
and a bearcat vhf lo/hi/uhf scanner.

Our office is loaded with thin ethernet & twisted pair & run about 1 cpu for
every 100 square feet. MAJOR QRM anywhere in or near building. Inside its
even worse, brick & block walls with metal roof & metal skin over outside walls
to shield against any outside radio signals.

I have brought all radios I own to work on occasion over the last year.

The bearcat won't clearly recieve 2m repeaters within 20' of the building.
(now this is a very wideband radio 30mhz-500 something mhz)

The RS 202 will receive 2m into the building about 5' inside main door.
The RS202 blows away the bearcat at home too listening to repeaters with
the duck inside of trailer. Noticably less noise & better sounding audio.

The Icom 2at will receive 2m about 15-20 feet into the building.
The Icom is the best of all, although it wont scan like the RS 202.
Oh well what do you expect for $90 used at a hamfest?! {:-)

You said:
That surprises me, Kevin. All the reviews I've seen say the "202" has
about the best immunity to intermod of any HT because of the fact that
it's strictly a 2-meter receiver (no out of band receive).

Now this is not a subjective test, but there may be room for improvement on
the RS intermod ability.

My $.02

Ed Bathgate
Expecting to be N3T?? in mid June {:-)

1664. Kenwood TS-450SAT

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-11 21:49:14 UTC
From: jcaradim@gr.oracle.COM
Message-ID: <9405112149.AA22341@GRSEQ1.gr.oracle.com>
Source record: 226888

Howdy,

I have a Kenwood TS-450SAT and I am pretty satisfied with it. One question thought.

Sometimes, when you power on the rig, and the RIT offset is showing on the display, the actual frequency is a couple of Hz off, the center (usually downwards). For example, the rig was left at 21.235.00 with the RIT set to 0 (zero). Power off, power on after some moments and the frequency is 21.234.98. Nothing serious, just enough to break your nerves.

Has anybody else notice the same problem with this rig? Am I too clumsy with the RIT control (don't think so, as I have test it again and again, it is zero before power off).

Mind you, technical details about the cause are not necessary (I'll spare you some writing) as I am not very technically oriented, just tell me if it is a malfunction or not (if it is, the local Transceiver Doctor will get some extra money).

Most of the FM activity is clustered at the high end of the band
per accepted band plans. You might, nonetheless, be happier with a
radio which has the widest possible coverage. My current handheld
favorite is the Standard C558A.
Good luck in the hobby.

Hello Everyone,

When I was growing up in the mid-80's, I used to read Pop Science, Omni, Sci. American, etc. Once in a while in the back, one would find an advertisement proclaiming U.S. Army Jeeps for sale. The price was low, because the jeeps were still disassembled.

There is a bit of folklore that these jeeps could be had for as little as $50. As a matter of fact, a friend had a friend that had built one. We all know how these stories end. No one I know has any ideas about finding a source for these vehicle kits. This is where you fit in.

Usenet News readers: Please alert me by email if you have seen these advertise-ments recently, or can come up with a name address phone for a jeep source.
TIA ! (Thanks in Advance)

1670. FT-530 New Jumper Locations?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-12 04:05:25 UTC
From: dws30@p1dbg02cd.amdahl.com
Message-ID: <1994May12.040525.27952@ccc.amdahl.com>
Source record: 226796

Just opened up My FT-530 for the expanded RX/TX mod. From all the
information I have found various artwork/layouts of where the jumpers
are located. Well I think I've got a new one.

```
| | Factory (US) Settings shown
| [1] |
| [0] | [1] = Jumper is Shorted (on)
| [0] [1] | [0] = Jumper is Open (off)
| [1] [0] |
| [1] [0] |
| [0] [0] |
| [0] [1] |
| [1] | <-- With this jumper removed:
| [0] X | 2m 70cm
| o / RX/TX: 110-180MHz 300-500MHz
---------------------------- 800-950MHz
```

This may be jumper 13 as the results are the same.

I am interested in the RX the way it is, but would like to know what
corisponds to the jumper 15. I would like to restrict the TX to factory
settings or close to it. (TX: 140-150, 430-450)

Anyone have the new mod sheet or figured this out yet.

Some things I have noticed about this mod. Automatic rptr shift goes
away. Also the 800-950MHz selection is stuck at 12.5KHz steps keyed or
dialed.
Still playing with it so I'm sure there are a few more.

>

Ahhhh.... I think the entire Military aviation band is AM, as
is much of the stuff below 406 MHz. The FT-530 can receive
AM in the "left" receiver -- and can tune 300 to 500 MHz
there. It CANNOT tune 800 there.... but as pointed out,
that isn't too much of a loss..... Hams CAN use
AM in 902-928 though....why --- is beyond me.

1674. AEA DSP2232 Mailing List started

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-12 11:28:37 UTC
From: dl3no@rmi.de
Message-ID: <2qt3t5INN8n1@infoac.rmi.de>
Source record: 226801

Hello,
due to lack of information on AEA's DSP2232 (e.g. SSTV) I started
a mailing list on this gear :-).

If you would like to subscribe write to:

dsp2232-request@rmi.de

with "subscribe" in the subject.

If you would like to contribute information, please write to

dsp2232@rmi.de

I hope, information (and users) will start soon.

Regards,
Rupert dl3no

>Thomas DL1JBE

Hi Tom

A friend of mine has a Ten-Tec Scout 555 and he has all kinds of problems
with it. It seems as though he is getting RF feedback in his rig. Ten-Tec
has told him that the rig was not designed to use a tuner and a long wire.
He also said that Ten-Tec told him that the RF sheilding is not as good
in the Scout as in other rigs. He has a good RF ground and the same
problem in both his house and car. This sounds funny to me but thats
what Ten-Tec tells him. He has returned the rig to Ten-Tec and as of yet
has not gotten a responce from them but he thinks he will get his money
back and by a Yaesu.

Good Luck

I used to do this routine...use the speaker-mic with my ht and then I used to clip it on to the seatbelt by my ear. I saw someone selling amplified speakers at a hamfest. Interestingly, the demo they had set up at the fest was using the same radio as mine (Yaesu FT-470). You could not hear the radio over the ambient noise. He plugged in this external Motorola amplified speaker and the sound came booming out! It was the best purchase I ever made! All I did then was plug the speaker into the earphone plug on top of the speaker-mic plug and the speaker was powered through the cigarette lighter outlet. So I still used the speaker-mic for a mic and then used this external speaker. Costs about $20 and was wonderful. I have seen them at hamfests many times since.

Of course now, I have a mobile rig but there are times that I'v thought of connecting that external speaker to my mobile rig :-)

This is accurate. Military jeeps, because of their suspension and very high
center of gravity, have a tendency to flip over when turning a corner at even
a moderate speed. WHen I was am MP in the Army in the '70s, two of our patrol
jeeps were accidentally flipped over in this manner.

The GOvt does not want liability for potential lawsuits, thus they are
quartered with a blowtorch before sale.

1679. ALinco DR600 troubles?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-12 18:18:32 UTC
From: kevin jessup <kevin.jessup@mixcom.mixcom.com>
Message-ID: <1994May12.181832.6621@mixcom.mixcom.com>
Source record: 226806

I recently purchased an Alinco DR600 2meter/70cm mobile rig from AES.

As I usually do when I purchase a new piece of equipment, I try to verify that is within published specifications. Well, the first one didn't accept the remote control DTMF commands that allow full remote control of the DR600. And it was NOT the DTMF decode board as we swapped it out and still had trouble. AES gave me a 2nd unit that DID work properly.

So basically, I had two new DR600s that I played with. Published specs for the DR600 power output are...

	VHF	UHF
High	45 W	35 W
Med	10 W	8 W
Low	5 W	4 W

For BOTH rigs, I got the following +-2 Watts...

	VHF	UHF
High	35 W	47 W (Note UHF output higher than VHF!)
Med	6 W	10 W
Low	3 W	5 W

Has anyone else experienced this? Anyway, I ordered the factory sevice manual and after much back and forth tweaking was able to get pretty close to published specs.

BTW, the factory power aligment proceedure did not agree at all with what I finally had to perform. The trimmer resistors and mechanical drawings for the UHF and VHF main boards did not macth what was actually in my unit. ANd no, I did not get the two mixed up. So has anyone else experienced this? Now that the thing is adjusted properly (POWER, DEVIATION, S-meter readout), it is an excellent unit. Just took a bit of tweaking.

Although this discussion is better carried out in policies newsgroup, when I was a ham in Indiana I was told to only have one ear covered. Also, at the time, it was STRONGLY reccommended that we carry a photocopy of our license with us at all times even if we had ham plates on the car. Sometimes that little piece of paper with an FCC seal on it helps convince the local deputy that you are legit.

: > PB-18 Long-Life 7.2V 1100A 2.5W on High Power (approx. 7.0 hrs.)

: The 7.2V/700mA came with the radio when i got my TH-78E.
: It's small and fits completely inside the rig. I mainly use it when i
: carry the 78 around. Good for listening but don't talk too much.

So, PB-13 is equal to BT-8 if you have 700mAh cells in the battery pack.
Personally I (and my friend here) have used only batterypacks with my
Handy. Why? Becaus it's much cheaper to buy few sets of NiCd cells to
batterypack than buy a original pack; then you can twist and shout with
the sets (in public transportation system) when replacing the used ones
with full ones :)

(I have IC-2SET and IC-W2A and they both eat same packs. First ICOM had
the battery pack (case) BP-86 and you couldn't charge the NiCds through
it but then came the BP-90 and that's the best for me now.)

I've never used dry-cell-batteries in my packs.

: to get a set of those new NiMH cells that claim a capacity of 1200mA.
: 73 Django
: DL5YEC
How much do they cost? (In DM)

: solder joint on 440mhz VCO".

: How are the rest of you W2A owners fairing in the 440mhz ticking battle?
: Aaron Wohl / ham callsign N3LIW / 412-731-3691 / 412-268-5032

I had the same problem back in the days when my RIG was new. A local guy
fixed it and said that there was a cracked solder joint.

After that it has worked just fine...exept I do need a new IC18 and a UT-63
would be nice too and the tone is T E R R I B L E (it's an Asia version) and
in dual-band receive the other band that's scanning or has PWR-saver activated
makes a little tick to the other band (70cm). You can hear it when there is no
modulation. Think what happens on packet..

It is in some uknown (for me) mode; not EU, not USA; the TX is VY wide Maybe
because of this non of the cross-band-repeater-keytechniques that I've received
have worked (the EU and USA ver. technique). Have any clue or do I have to
change it (SOMEHOW!) back to some houmankind mode to joy the cross-band-RPTer?

Have you any clue where I could get a PWR-socket for it?

>KF9VC

Hmm... I think this recommendation is kinda moot, since we all follow
the FCC rules to the letter, which states:

97.9 Operator license. - (a) There are 5 classes of operator li-
censes: Novice, Technician, General, Advanced and Amateur Extra. An oper-
ator license authorizes the holder to be the control operator of a station
with the privileges of the operator class specified on the license. The
license document or a photocopy thereof must be in the personal possession
of the licensee at all times when the person is the control operator of a
station.

Looks like driving a car or not, you have better have that little piece
of paper with an FCC seal on it. The Candy Company may have a field
day with you if you don't :-)

1686. ARK4 QRP CW Rig Questions

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-13 01:19:36 UTC
From: nyoung@desire.wright.edu
Message-ID: <1994May12.211936.22158@desire.wright.edu>
Source record: 226809

The letter is in the envelope waiting for me to go to the bank and get a counter check/draft for the money to buy it. So advise will have to come quick and sweet.

I am considering (seriously considering) purchasing one of the ARK4 40m CW QRP transceivers that S&S Engineering had on display at the Dayton Hamvention QRP suite (& on the convention floor next to the G-QRP Club booth).

I don't read the magazines because it only reminds me of what I am missing (and have been missing) since we moved to this dump 9 years ago. Does anyone have any experience with the ARK4 as a kit or as a piece of equipment? If a kit, was it easy to build and all that (parts all there, etc)? If as equipment, how did you feel that it worked? Where you satisfied? All the other questions about filters and audio and QSK and keyer and all that as well: how, who, what, why, when, where, etc?

Flames welcome (like the icy stare I get from my wife when I start railing against this "this old house" money pit is cold enough... so Flame me or give me $20.).

Agreed. The sigle-earpiece/throat-microphone rig you can buy is
a really good investment for HT's. I've tested two of them, and
found their performance to be very good. It's better to get the
complete package, which has earpiece, mike, and an inline PTT button.

>What are the legalities of using a headset/earphone while mobile? I searched
>the Indiana Code index the other day and didn't find anything related to it.
>

In Michigan, it is ILLEGAL to wear a full headset while driving.
Full refers to having both ears covered, or the ear canal with
insertions. It is LEGAL for you to wear a one piece earphone or
one sided headset, like the kind you see at drive-throughs at McDonalds.

For the sake of saftey, this is why it is illegal. It is easier
to hear emergency sirens in most cases than it is to see them.
The idea is to utilize both visual and auditory senses, not eliminate
or otherwise engage the other. This is why in some areas you
can be pulled over and ticketed for having loud music/etc from your
car which isn't above the 'disorderly conduct' statute, but is
above the awareness threshold. Go make sense outta that one!

>: over the years on the net. I picked up a couple at Dayton and I
>: would like to get a better idea of how to charge them. If someone
>: can get me some info or tell me where some of this info is posted
>: I would appreciate it.

Here is some info I compiled from various sources on lead-acid (and SLA).
Corrections welcome. Most of this came from mfg. data sheets.

SEALED LEAD ACID BATTERIES FACT SHEET

CHARGING
========================
Quick Reference: Float: 13.65v
Cycle: 14.70v

Float Charge: 2.25v to 2.28v per cell (Power Sonic) 12v = 13.50 to 13.68
2.25v to 2.30v per cell (Yuasa) 2.275v/cell reccomended
Current: No limit (battery will only draw what it needs)

Cycle Charge: 2.40v to 2.45v per cell (Power Sonic) 12v = 14.40 to 14.70
2.40v to 2.50v per cell (Yuasa) 12v = 14.4 to 15.00
Current: Normal is 20% of capacity. Max is 25% capacity
Charge to 2.45v/cell (12v = 14.70v) until current drops to 0.01C
then switch to float setting.

A fully charged battery will rest at 13.5v to 13.8v

Equalizing Gell-cells is not reccomended

Sealed batteries do not vent. Venting implies damage to battery.

DISCHARGING
========================
Depth of discharge depends upon the load. If the load is small the voltage
should not drop as low. If the load is large the voltage can drop lower.

Discharge limits: at 0.1C - 10.7v
0.2C - 10.5v
0.6C - 9.7v
1C - 9.1v

Cycle service will provide about 1200 cycles at 30% depth of discharge(DOD)
Float Service will cause capacity to drop to 80% after 3.5 years, and 40%
after 4.5 years.
Battery will self discharge at about 3% a month. An idle battery should be
boosted every 9 months.

For current calculations based on capacity, keep in mind that older batteries will not have the same capacity as the battery is labeled. This is particularly important in calculating DOD.

TESTING
==========
BATTERY SHOULD BE AT REST FOR AT LEAST ONE HOUR.

CONSTRUCION
==========
GELL-CELL: Lead Calcium (Power Sonic) or Lead Antimony

CHARGED:ANODE:LEAD DIOXIDE, CATHODE:LEAD ELECTROLYTE:25% SULPHURIC ACID 75%
WATER.
DISCHARGED:ANODE:LEAD SULPHATE, CATHODE:LEAD SULPHATE ELECTROLYTE: 5% SULPHURIC ACID, 95% WATER
TEMPERATURE: LOSES 20% CAPACITY AT 40F

Can't speak for Indiana, but in Virginia wearing any type of headset
while driving is against the law; I think the fine is in the $75 range.
Several urban counties enacted this legislation a number of years ago before
the state did, but now it's a statewide law.

I also use an HT, and have found that the speaker/mike works better
than the built-in speaker. A larger speaker might be even better, or try
one of the Radio Shack amplified speakers (I think they still sell one).

> schwart6@educ.ucalgary.ca

I've never tried to tune a CS-0510 that low before but it can probably
be done. 146MHz is pushing the edge of its range so it might not be
a peak performer but it will only cost you $30 or so for a pair of
crystals and a bit of time to find out how well it will work. It
may be that the tuning slugs in the receiver will not have enough
range to peak it up but all the same it is worth a try. Drop me a
note if u want me to fax you the alignment instructions.

1697. Need FT530 extended RX mod (17 batch)

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-13 17:03:55 UTC
From: willmore@iastate.edu
Message-ID: <willmore.768848635@kiev.gis.iastate.edu>
Source record: 226822

Does anyone have any experience with moding newer FT530's
into extended RX? The layout of the board is different than
that shown in all of the mod sheets that I have looked at.
My radio is of the '17' batch variety. I've tried what I
think is J13 and I have completely reset the radio (power off
w/no battery overnigh turn on with /\ and \/ depressed) and
no luck. I have also tried powering it off for a long time
and turning it on while holding MR and VFO. That didn't
work, either.

Any suggestions? Is there a new mod sheet for this batch of
radio? The radio seems strange in that it can do almost
all of the VHF band both FM and AM but it can only do the
strict 430/450 subpart of the amateur band on the UHF side.

Please post or mail (I'll summarize) any suggestions.

Thanks,
David

OK. I'm convinced not to buy the Rat Shack HT but instead, I'm now looking at the FT-530. With all the good features this radio has, what are the cons (other than being double in price)? My brother has this rig and loves it. While I will have 8 - 12 weeks to wait for my ticket from the FCC, I think it's worth saving the extra $200.

I have both the Yaesu FT-530 and the Radio Shack HTX-202. I like them
both but would make the following observation: the FT-530's speaker
is not capable of producing loud audio. It's just fine when you are
in a quiet place, but when things get noisy it's hard to hear (even
in a quiet car). Because of this, I almost always use the HTX-202
instead, which can make an amazingly loud sound. Besides, the HTX-202
has many other desirable features as well, such as superb intermod
immunity and the fastest scanning I have ever seen in an HT, not
to mention a very good price (I got mine from Marymac).

Best of luck with whatever you purchase.

I bought a 600 earlier this year. I measured the RF out soon after I bought it. I found that the VHF was around 40 watts, and the UHF around 30 watts. Since it was only 5 off, I didn't worry much about. It is interesting to hear that you were able to peak it up though after getting the service manual.

A more experienced ham explained to me that manufacturers spec the rigs out under ideal conditions. Probably at 13.8V or more DC in, all the amps it can eat, nice temperature, and into a real good dummy load.

It truly is a nice rig, and a pleasure to operate. I don't mind being an appliance operator when I have a rig like the 600.

I am eight days away from our local HAMFest and I plan to buy a dual band 2m/70cm HT in the $400 price range. In researching, I have been leaning towards the Yaesu FT-530, but there are several around the same cost.

Alinco DJ-580T
Kenwood TH-78A
Standard C178A (new assumably to compete in the $300-$400 range)
Standard C528A (costs more)

I would appreciate any opinions (pro or con) about these radios. Thanks...

I like ft530 except one thing.
The rubber knob (memory dial) was fell off a few times, I has been lucky so
far because I found all the times. Now I glued it.
Also I noticed that power on switch has been turn on and off accidently.
TH78 does not do that, where you have to press a little bit longer
than ft530. Otherwise, this little 530 is very fine.

The knob is a warranty fix -- Yaesu will send you a part for free
that has a locking insert. I put mine on and it ain't coming
off.... I have noticed the second problem. That's what
auto power off is good for :-)

As a matter of fact YES.

YAESU FT-530

Expanded Receive 110-180, 300-500 MHz + 800-950MHz
Expanded Transmit 130-180, 400-470 MHz

NOT LEGAL IN U.S.A - FOR EXPORT ONLY

o Remove Antenna and Battery.
o Remove four screws on bottom holding battery track.
o Remove the four (black) screws holding rear case.
o Slowly... open the front cover from tranceiver and lay both halves on table.
o Note positioning of white paper insulator in right half of radio and lift out
(don't throw away)
o Carefully locate Jumper Pad 13 and remove solder.
o Carefully locate Zero Ohm R-Chip (Jumper 15) and remove.
o Re-install white paper insulator, make sure ground tab slides through the
paper insulator.
o Close radio back up (Careful not to pinch the ribbon cable near lithium
battery when closing halves).
o Re-install the four (black) screws holding rear case.
o Re-install the four (small silver) screws on bottom holding battery track to
radio body.
o Attach Antenna and Battery.
o RESET THE RADIO: Press and hold both arrow keys while turning on the Radio.
o Modification Complete.

Yes, I have experience with this, but a rather kludgy answer. In fact I've been scanning this newsgroup for other owners of 990's to discuss this with... I mostly SWL, and love the receiver in the 990. Much nicer than my Kenwood TS440's was, except that the audio out of the 440 sounded much better than the 990's in AM! The high-end from the 990's audio is really deficient.

I looked into a few different audio filters for amateur use, but then one day I was at Radio Shack, and ran across a car stereo equalizer/amplifier on sale. I bought it for (I think) $45; I put it in line with the speaker output, connected my Motorola mobile external speaker, and have the 15k pot at maximum, the 6k pot just below max.

This equalizer goes into bypass if you turn it off, permitting quick A/B comparisons, and now the AM audio of this great transceiver is listenable for me. I know I'm probably doing my eq in a kludgy way (Radio Shack? on the output audio? sheesh) but it works.

Regards
--Rob

PS. Should we start a little mailing list for 990 owners?

1712. PK-232MBX vs. MFJ-1278B

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-14 05:23:21 UTC
From: steve@vigra.com
Message-ID: <STEVE.94May13222321@hobbes.vigra.com>
Source record: 226838
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

I went shopping for my first multimode TNC today, and pretty much narrowed it down to the MFJ-1278B and the AEA PK-232MBX. I'd love to hear from you net.hams about which you prefer and why. Here's my comparison based on what I know so far, which is pretty much from adverts and data sheets. If you have any pointers to reviews that might help, I'd like to look them up.

I've read the packet FAQ and some other literature, and decided that I will probably be using the TNC for more receiving than transmitting. I'd probably have it hooked up to a Unix workstation most of the time, maybe a DOS machine on occasion. I'd like to experiment with TCP/IP under FreeBSD as well. I'm also interested in receiving all the mystery digital broadcast tidbits on shortwave, especially wefax and other images.

The PK-232MBX claims the following:
$299 at HRO ($399 list)
Rx & Tx: Packet, Baudot and ASCII RTTY, ATOR / SITOR ARQ and FEC,
Morse code, WEFAX, PACTOR, and Gateway.
Rx: NAVTEX/AMTEX and TDM
18K (non-expandable??)
PakMail
17-pole "effective filtering"
SIAM ("for auto RTTY signal ID")
Host Mode

The MFJ-1278B looks like this:
~$299 at HRO ($299 list)
Modes: Color SSTV, Color Fax, "16 Gray Levels Modem", Packet, AMTOR, RTTY,
ASCII, CW, Fax, SST, Navtex
32K RAM (expandable to 128k, 512k)
Contest Memory Keyer
Free AC power supply
"random code generator" (?)

Both have KISS mode, which is important to me, since I like to hack protocols and TCP/IP stuff. I avoided 9600 baud TNCs, since they tended to have less modes, and I don't have a 9600-capable radio. Here are some questions I'm hoping to answer:

What is special about "PakMail(tm)"?
Is the PK-232 fax grayscale or 1-bit B&W?
Is the MFJ fax really full-color, or is it "color shading" instead of gray?
How common are SSTV transmissions?
How valuable is the new "Gateway" mode of the PK?

Do most people find 18k to be adequate RAM?
Are there any features that make one unit significantly better than the other?
Are there any glaring problems with either?

The salesman at the local HRO was *very* pro-PK. He strongly recommended it over the MFJ. His explanation was that it was a much better designed TNC, with a lot of support from AEA and amateurs. He claimed the filtering and reception on the PK-232 was superior to the MFJ. I don't have any reason not to believe him, but I'll take an unbiased group opinion from the net over HRO's anyday.

I'll be reading this group carefully, and will post a summary of any responses I get via e-mail. Thanks in advance!

Here in California, I once got a real traffic ticket (moving
violation) for wearing headphones while riding a bicycle. The cop
said it would have been the same ticket if I had been driving a car.
That was back in '88, but laws rarely become more lenient over time.

I have been told (by non-officers) that it's OK to have *one* ear
under a headphone, but not both. The theory is that you wouldn't be
able to hear sirens & important things through open-air headphones.

Of course, it's perfectly legal to blast a mobile kilowatt audio
soundsystem with the windows rolled up... :-)

> a state law in Illinois.
> Chuck Hawley KE9UW, Urbana,IL

Thanks very much for this EXTREMELY pertinent litle tidbit!
It just so happens that I do have a homebrew headset (single ear) and I do have
amateur plates. Now I just have to fix the headset (again...) Think I'll
use the PTT switch out of the old speaker-mic :)

Cutting the blue wire, I believe, opens up the ability to transmit on the aircraft band - a VERY dangerous 'feature' to add as if you transmit accidentally on that band, you will be sure to see one of those little ugly green FCC trucks pulling up to your house within 5 minutes.

The air band is AM. This radio can receive on AM, but cannot
transmit on it. Mods can allow you to transmit on VHF-UHF bands, useful
for MARS/CAP and some emergency work that allows you to TX legally
wherever it is useful

The best place to find manuals is to hit the local amateur radio
swapmeets. I was at one today in So. Cal. and my friend picked up 3
manuals for Motorala radios. Usually there at several people at swapmeets
with Motorola manuals.

Changes: new mailing lists, .packet rmgroup, and .policy updates

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 18 September 1993 to add the mailing lists for the new rec.radio.amateur newsgroups, to note the rmgroup of rec.radio.amateur.packet, and to officially retire some (in)famous threads of discussion on rec.radio.amateur.policy.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began to dominate other topics in the group and on the list. This resulted in the logical solution: a group was created to hold the packet discussion, and another corresponding mailing list was created as well: net.ham-radio.packet and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great Renaming essentially unchanged, moving from net.ham-radio[.packet] to rec.ham-radio[.packet]. Readership and volume grew with the rest of the network.

The INFO-HAMS mailing list was originally run from a US Army computer at White Sands Missile Range, SIMTEL20. There were few problems with this arrangement, but one was that the system was not supposed to be used for commercial purposes. Since one of hams' favorite pastimes is swapping gear, it was natural for hams to post messages about equipment for sale to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use restriction, and after some argument, a group was created specifically

for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize

this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, should be removed by September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas,

commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

1724. TH78 No more 800 mhz rx?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-15 15:55:05 UTC
From: ppddgc@uwovax.uwo.ca
Message-ID: <1994May15.115505.1@uwovax.uwo.ca>
Source record: 226700

I just bought a Kenwood TH78A Dual Band at Dayton and have had the wide band modifications done to it. Important to me was 800 mhz public safety receive but it seems that it will not cover there. It will receive the 300 mhz extended rx but not 800 mhz.

The tech did the D3, D4, and removed the W1 jumper. D1, D2, D5 and D6 are all present. We did the memory reset. Did we miss something?

Any help would be appreciated.

I've been looking at the Yaesu FT-530 and the Alinco DJ-580 for when I eventually dump my Icom IC-24AT piece of garbage. Although I haven't played with both radios much -- just pushing buttons while at AES Clearwater -- they seem to be pretty much the same. Advantage Alinco: the volume/squelch dials are larger. Advantage Yaesu: the ability to receive two VHF or two UHF freqs, instead of one VHF and one UHF, at the same time.

1733. HT advice needed ASAP

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-16 14:15:59 UTC
From: djw@cci.com
Message-ID: <CpwFMn.13u@sunsrvr6.cci.com>
Source record: 226706
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

Greetings all,

I have a question for those knowledgable folks on the net. I am looking to pick up an HT at the ham fest coming to Rochester this weekend. Specifically, I am looking for an 2m HT that can be modified to operate on VHF marine frequencies (yes, I know out of band operation is illegal, but I want it as a back up on the boat, if my main radio goes south, or the battery goes dead, or whatever, I want to be able to call somebody on CH16!).

So, does anybody have a list of HTs that are modifiable to operate on the Marine band?

Reply via email as the local ham fest is this weekend. (Nothing like waiting until the last minute, I guess!)

Thanks in advance.

Dave Wright, N2TYR, djw@cci.com

The third jack is the wide-band antenna jack (the 1/8" mono plug).

FOR SALE:

Kenwood TR-2600a VHF hand-held transceiver
Softcase
new NICAD battery
new lithium backup battery
charger
original box and manual
Receive 140.000 - 159.995 (can be modified for MARS)
Transmit 144.000 - 147.995 (but don't ask me how...)

asking $100

Heathkit HW-101 HF Transceiver with Power Supply/Cable
preamplified microphone
"Lifetime" warrantee finals (2 6146a finals)
cooling fan added for mounting in cabinet
covers 80-10 meters SSB/CW
good first rig

asking $100 obo

Purchased new equipment and don't need them any more.

1737. Yeasu Ft-530/MH-29 mic

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-16 18:12:59 UTC
From: moreno@key.amdahl.com
Message-ID: <1994May16.181259.8497@ccc.amdahl.com>
Source record: 226713

A friend of mine has the mh-29 mic with the frequency display and other controls.
He has been told that, when he transmits, his audio is poor. Yeasu is aware of
problems with the mic element and replaces the element upon request.

I looked at the mic and can't see any opening in the case for the mic element.
I remember seeing some info about another manufacturer's mic that needed the modification
of drilling an opening into the case to get rid of the muffled audio problem. Is that
modification also needed for the MH-29? If true, it would
solve the problem better than just changing the mic element - the new element
might not sound any better without the opening in the case.

Thanx for any info on the matter.

Bob

1738. TEN-TEC kits

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-16 19:37:52 UTC

Source record: 226714

Hello All

OK, a while back I sent for and just received a catalog from
TEN-TEC their latest catalog of kits. I anyone wants one just call the
number 615-453-7172 and ask for the kit catalog.

Here are the kits in the catalog:

1. 2-Meter HT RF Power Amp, 1 to 5 watts in, 20 to 30 watts out
2. SSB-CW-FM 6- meter transverter
3. All-band Argonaut II RF deck
4. 9-band Shortwave receiver
5. Hi-Sensitivity Detector-Amplifier with experiments
6. Communications Desk Microphone
7. Mobile/Handheld Microphone
8. 10/200 Watt SWR bridge & rf wattmeter for both 1.8-30 and 144-148MHZ
9. RF dummy Load, dry 50 ohm, 300 watts
10 "G5RV" antenna kit
11 Compact RF Ground Counterpoise
12 High-Power Variable Capacitor
13 10 Memory 2 Meter FM/Data transceiver

Then more kits called T-KIT Module Boards... the very best in "little
Kits"!
Then also in the back are different enclosures you can order.

Marty Hartwell KD8BJ

I am not in any way involved with TEN-TEC just a satisfied customer.

1739. ?? Need help with an external short wave radio antenna ??

I need to gather some info on building an antenna for short wave reception? Please excuse my ignorance, I am very new at this. Someone told me that All I need to do is connect a very long thin wire from an adjacent tree to the house and one from the ground and connect them into the adapter that goes into the external antenna plug. I have some questions:

1) How long should this wire be? Is it somehow related to the frequencies that I am interested in? What if I am interested in more than one?

2) should the wire be shilded or unshielded?

3) what should be the gauge of the wire? The thicker the better?

4) should the wire be the meshed type or a single thread?

Source record: 226716

Chuck,

I have noticed the same problem with the 990 and remembered the QST reviewers making a similar comment. About the only thing that will help is the use of a good external speaker or some headphones. The speaker in the radio seems to emphasize the low frequencys too much. I use a Radio Shack Minimus 7 and am quite happy with it. A slight twist of the IF shift will also help a little bit on SSB.

From: dws30@p1dbg02cd.amdahl.com
Message-ID: <1994May17.013933.522@ccc.amdahl.com>
Source record: 226719

According to a Yaesu rep. after some date in June or July RX/TX equipment are not permitted to receive the 800MHz band (even by modification) In the case of the FT-530 new design levels of circuit boards will exist that can not be modified to take in 800MHz. The basis for all this is our friendly (over medeling) goverment. Probably the result of Cell Phone Co's.

The Yaesu rep. knew I was the owner of a 530 when I was told this info, in case anyone is curious if this info was stated just to make a sale.

'Tis true. Drop me a line if you get one and I'll send you
instructions.

My number one complaint with the radio: Not enough receive audio.
A headset microphone fixes that for mobiling.

Other than that, I like the radio a great deal.

> I am skeptical of the feature which adjusts transmit power based
> on the strength of the received signal. Has anyone used this? Did it
> work OK?

I've never tried it. I think it's pretty much a gimmick.

hi, mitch wa4osr here in mobile, alabama...

my sharp pc-6200 was dropped and the lcd display
was damaged... upon taking the display apart, one
of the surface mount column drivers was cracked...
rendering the display unusable... therefore,
i am in desperate need of the lcd display panel...
the part numbers on the display panel are LM64N671
and 90D13145W ... both numbers are on the panel...
my pc-6200 is actually a pc-6220, which
i think indicates that it has a 20 mb hard drive...

i bought the pc-6220 used with absolutely *NO* docs...
it has the 2400 baud internal modem... i need *ANY*
info, but especially would appreciate a copy of the
owner/operator manual... i will gladly pay for
copies/postage...

if anyone can help with a source of the lcd panel or
with the docs please email me or call me collect
at the below numbers...

thanks for any help/leads...

I have tried numerous external speakers and have only had success
using the outboard equalizer mentioned in my previous post.

For sideband the IF shift is great, but for AM it won't do anything,
of course...

Source record: 226732

Hello,

according to a ham I talked with yesturday :

1. The beep sound we hear at some frequencies signals that the PLL cannot be locked (The VCO is out of range). No wonder I receive nothing in the 50 MHz range.

2. There is a potential flaw in the air-band. Between, I guess 125 and 127 the rig unlocks ; this, the OM told me, is the result of bad software design. The processor switches a coil on too soon, so the frequency cannot be reached. Does anybody know a workaround for this problem ? Alternatively, it may be a problem encountered on the TH 78E only.

3. Is there a way to switch between AM and FM in the low-VHF range ?

4. The Answerback option is - on the European version -
done by the POWER + BAND combination. (NOT POWER + MHz which doesn't work).
It displays a "AS ON" or "AS OFF" message.

Amps do work, but my opinion is that your money is better spent on a good antenna. I have a few VHF amps and after I built a quad antenna, I stopped using them. With amps you need high current (8 - 15 amps) which is not a problem when mobile, but at home it can pose a problem (I find floating gell-cells is the cheapest solution). If you don't have a decent antenna already, the amp isn't going to be that effective. If you do decide to get an amp, with a decent antenna, I would be surprised if you needed more than 30 watts for any repaeter work.

Hi,

Does anyone know if there is a wideband transmit mod for the Alinco
DR-592? I need to be able to transmit in the 420-430 MHz range.

Thanks,

Rory Burke

I have bypassed the 6KHz AM filter, and had no improvement. All modes go thru a Low Pass Filter in the audio section before any additional amplification. This amp has it's frequency rolled off at 3KHz (down 3db). Next time I have the cover off, I'm going to move it out to 4KHz. The AM has the same highs as SSB, but it has so many lows that the treble to bass balance is way off. Makes it sound like all bass.

I have been using a small amplifier with my HT for the better part of the last year. I'm able to hit any repeater in town and have not gotten any complaints about a noisey signal from other stations.

I am running an Icom 02AT with a Ramsey 2m amp. 5w in gives 30 out. I have the setup configured so that I can pull the amp out of the car and run it off of a power supply in the house.

The advantage of using a setup like this is that it forces you to get a better antenna to connect to. I use a Radio Shack 5/8 wave mag mount in the car and have a modified R.S. scanner antenna mounted on the house. Works great.

You can find Ramsey ads in just about any ham magazine. I just got the June 73 and the ad is there. I think the amp costs less than $100.

Source record: 226744
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

Since this request falls under both digital communications and equipment,
I'm crossposting -

I'm budgeting for a multi-mode, and am eyeing either the AEA PK232MBX or
the AEA PK900. What are the comments pro/con with each?

How about comparing/contrasting them with the Kantronics KAM Plus.

I'm looking for people's experiences with performance AND reliability for
the price. For now, I plan on doing a lot of receiving.

Additionally, can any of the above units receive the 137Mhz NOAA weather
satellites? If so, what is/are the requirement(s)?

Thanks for any info you can provide.

I will summarize if I get enough responses.

Scott

I have a HR2510 inside a diesel powered 87 VW. When I key up I experience one or more of the following symptoms: an alarm I have never heard before, a wild tachometer, seat belt warning light, oil warning light, clicking noise in the fuse box. The latter is the most common. I am glad that I don't have a computer in there controlling an engine (my diesel is mechanically inclined so to speak).

I have a direct power line to the battery and a glass mounted antenna. I tried 3 other antennas & coax cables...no difference. SWR is within acceptable limits. Does anybody have any suggestions ?

James, I'm in the process of modifying a Micor for the 2 Meter band. I have it working now as rock-bound rig on a local repeater. I found two of these cheap at a police auction. The trick with Micor's is that you have to buy them *really* cheap, so you can spend $'s modifying them. I managed to get the channel elements donated, and a manual donated. I modified the receiver first, and it sounds great... The trick here is that you have to replace the helical coils in the front end... About $35 from Motorola. The rest of the mods were not bad, but you have to unsolder the RF cans to get to the parts. The manual shows you what you have to modify to bring the rig down to the 2 meter band.

On the TX side: I was able to get away with (so far) of just modifying the Exciter. This took some time, but can be done. Just use an analyzer to retune it and the TX channel element. You can tune the Power Amplifier to the 2 meter band, but no guarantees. I had to crank down one of the tuning caps to get it in tune. My TX was 146.250, so I know it can tune that low. Also, I found a bandpass and harmonic filter for the 2 meter band($25o/pair), but I think you can tune the bandpass that is designed for the 150.8 MHz model down to the 2 meter band. Some instructions are around on how to do this by using a spare one, and drilling holes in the top so you can tune the coils. I've not tried this yet.

One other note: NOT ALL MICORS can be modified to the 2 meter band. The one's I have are the 73 series (90/110 Watt models). I don't think the 60 Watt model can be modified.

This radio is not very cost effective to modify, but then I'm doing this as a project to learn about this, and I'm going to convert it into a repeater to replace our dying repeater here at Washington University.

Hope this helps,
If you have any questions send email.

EMI/EMC Testing Technician
==========

Hewlett-Packard's San Diego Division is looking for a Senior Electronic Technician to help construct, and later operate, an RF semi-anechoic absorber lined chamber (ALC) as part of its Quality Department's Hardware Test Center. This chamber will be used as an R&D tool to enhance our ability to design FAX machines compatible with world-wide commercial regulatory requirements limiting electromagnetic interference (EMI).

Requirements:

Associates or equivalent degree in Electronics or Physics
Demonstrable experience with RF connectors/cables, soldering (Through Hole & SMT), electronics assembly, and fundamentals of programming in BASIC or C.
Demonstrable relevant experience with EMI, EMC, RF circuits & systems, electromagnetic, antennas, or similar topics.
Verifiable experience with electronic test equipment, setting up and operating computer workstations or personal computers.
Excellent verbal and written communication skills.

Desirable Experience:

Good people skills.
Specific experience with spectrum analyzers, receivers, antennas, transmission lines, or EMC troubleshooting.
Experience with applied electromagnetics in the VHF or UHF frequency regions.
Evidence of creative and independent problem solving.
Previous experience with commercial EMC measurements.
Familiarity with FCC and European EMC regulations
Ham radio or FCC commercial radio licenses.
NARTE certification.

---begin former article---
From: salavi@unity.ncsu.edu (S. Alavi)
Subject: ?? Need help with an external short wave radio antenna ??
Date: 16 May 1994 20:18:10 GMT

I need to gather some info on building an antenna for short
wave reception? Please excuse my ignorance, I am very new at
this. Someone told me that All I need to do is connect a very
long thin wire from an adjacent tree to the house and one from
the ground and connect them into the adapter that goes into the
external antenna plug. I have some questions:

1) How long should this wire be? Is it somehow related to the
frequencies that I am interested in? What if I am interested in
more than one?
The longer the better. For receiving, it won't matter how long.

2) should the wire be shilded or unshielded?
Shielded will cause you less problems.

3) what should be the gauge of the wire? The thicker the better?
It won't matter for receiving.

4) should the wire be the meshed type or a single thread?
It won't matter for receiving.

Hmmm... if you get a "low split" receiver, you don't need to do anything but
tune it up. Even the "mid split" receivers will usually tune down OK.

Hmmm... the exciters only differ in the value of several silver-mica caps.
If you look at the exciter circuit diagram, it gives a chart of split vs.
capacitor value. Just replace them on the exciter.

The PA is a little finicky, but a mid-split PA came down to 145MHz OK for me.
Oh, yeah, a 60W PA, too.

>One other note: NOT ALL MICORS can be modified to the 2 meter band.
>The one's I have are the 73 series (90/110 Watt models). I don't think the
>60 Watt model can be modified.

Well, the model # (T73, T43, etc.) only indicates VHF high-band power level.
I set up a choice T73RTA for 145.01; it is a low split radio, I just followed the
tuneup directions with no problem. I've also set a few up on 145.xx which were
mid-split radios.

>This radio is not very cost effective to modify, but then I'm doing this
>as a project to learn about this, and I'm going to convert it into a repeater
>to replace our dying repeater here at Washington University.

What??!!?! Maybe a high-split isn't cost effective. Low split radios don't require modifications at all, they just tune up. Power level has nothing to do with it, either. Mid-split radios usually tune-up without problem, too.

If you can set a T73 Micor up on 2m for $100 (like I did for packet), it is a killer deal. Few modern import radios have as strong a receiver and an exciter as clean.

Internet address: william.eckle@twb.com

From: Frederick Franz (WA6VHB)

I have for sale or trade two VHF mobile transceivers.

(#1) Icom-230, PLL, synthesized, 67 channels, 146 to 148 Mhz. This
unit covers the bandwidth in 30 khz increments. This is the
original band plan for 2 meter repeaters. E.g., 146.76; 146.79;
146.94, etc. The repeater offsets are -600 and +600khz. The
radio also operates on any of the simplex frequencies, e.g.146.52;
146.55; 146.58 etc. The power output is 10 W. This unit features
an analog type S meter. The radio does not have DTMF or PL
(CTCSS), however there is a an accessory connector for 9V. power
take-off and audio input. (I have used this for external DTMF and
it works fine). The unit also has a jack for external speaker.
Price is $100.00 OBO. (See swap info below).

(#2) Icom-280, PLL, synthesized, 559 channels. 143.9-145.995 Mhz in
5 khz steps. 146.01-148.11 Mhz in 15 khz steps. This is a later
version than the Icom-230 for an expanded 2 meter band plan.
The repeater offsets are -600 and +600 and the radio operates
simplex on any of the channels. This radio has a dual power
output selection of 10 watts or 1 watt. The frequency display
is a 4 digit bright red LED type. This radio also has an analog
type S meter, and a jack for an external speaker. Also featured
is a 3 channel programmable memory. No DTMF or CTCSS.
Price is $160.00 OBO. (See swap info below).

Both of the above mobile units come in factory boxes with manuals and
accessories: mounting bracket; power cord; extra fuse; and hdwe.
These radios are in good condition and I'll even pay the shipping!

I'll trade both of the above radios for a used dual band VHF/UHF
radio such as the Alinco DR570T, DR592T or DR600T. (DR570T or
DR600T preferable). Or if anyone has dual bander and doesn't want
to trade, I'll offer cash. (The amount depending on condition, and
if manual and accessories are furnished).

1783. Yaesu FT990 mailing list anyone?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-05-19 23:27:20 UTC
From: rob@xyzoom.info.com
Message-ID: <1994May19.232720.23723@xyzoom.info.com>

I've started a mailing list for Yaesu FT990 owners. If you'd like to subscribe, send a message to 990-request@xyzoom.info.com stating your wish. There are only about 6 subscribers so far, and volume is very low, but perhaps it could be useful (in fact I appreciate low-volume mailing lists better than the other kind). The address for the list is 990@xyzoom.info.com.

I'd bet ten bucks that if you run a good quality ground from the radio
chassis to the car chassis (and if there's $10 in the balance, add
this: put a ferrite doughnut on the cable near the antenna), your
problem would be solved.

I fixed a problem on my last car with symptoms very similar to what
